Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., May 1, 1929. Sealed bids will be opened in this office at 3 p. m., May 24, 1929, for the construction of a retaining wall at the U. S. custom house, Niagara Falls, N. Y. Drawings and specifications may be obtained from the custodian of the building or at this office, in the discretion of the supervising architect. JAS. A. WETMORE, Acting Supervising Architect.

The annual spring outing of the Philadelphia Builders' Exchange and Employers' Association will be held at the Manufacturers' Club, Oreland, Pa., on Wednesday, May 15th. At 1 o'clock the Golf Tournament and sports will begin, dinner will be served at 6 o'clock and the entertainment will be at 7.45.

CHINESE ARE OLDTIME BRICK-MAKERS AND MASONS

Long Before the Great Wall of China Was Built Largely of Brick They Had Mastered All the Intricacies of Both Making and Laying Them

China is old and wise and inscrutable, yet, for all that, very childlike. More than any other nation today she needs a guardian. Yet for centuries China has been doing things which some other peoples, scattered here, there and yonder up-

on this terrestrial sphere, will not be doing for centuries to come. Times have been when China was as far ahead of the world at large, from the viewpoint of knowledge and progressiveness, as she is now behind it. The Chinese have forgotten more than many another race knows today or may ever know, and much that it would have profited her greatly to have remembered. Somewhere along the line there has been a peculiar hiatus in the Chinese intelligence. Yet she muddles through.

Clayworking in its various phases has long been a Chinese art. How long it is is impossible to say. More than 3,000 years ago the Chinese were making porcelains that today are priceless and which have never been surpassed in their high quality and rare beauty. It will be worth your while, the next time you stop at the art museum, to examine the specimens of the Ming dynasty (1368 B. C.), if they are fortunate in having any. Some of them are worth their weight in gold. China isn't making that grade of ware today. The art seems to have been lost.

Naturally it follows that long before they attained such a mastery of porcelain-making they had solved the infinitely more simple problem of brick manufacture. And how well they made brick and how they held them in esteem is attested by the millions of huge burned brick that are still in the great Chinese wall, built more than 2,000 years ago for defense against the marauding Mongol and Tartar hordes which were over-running the country.

In that tremendous work the Emperor Che-Hoang-ti imposed upon each province in his domain the task of making a certain allotted number of brick and delivering them at some point along the route where thousands of masons were ready to put them into the wall. History records that the wall was begun in the year 214 B. C. and not completed for half a century.

In every Chinese city of importance brick has always played an important part in the construction work. Brick walls were built around them for defensive purposes just as brick houses were built inside them. Brick were used in erecting the pagodas which dot the land. They went into the walls of the royal palaces as well as into the homes of the common people, only there was a clearly specified difference in quality.

The brick of which the Emperor's Palace in Peking was built were the acme of the brickmaker's art. Golden in color, and glazed to the highest degree, they were virtually terra cotta. The golden-colored brick were for the royal use alone, and went into the government buildings and palaces only. It meant the headsman for any but the Imperial families to use

them, and this distinction endured for centuries.

Dark blue and purple tiles, peculiarly rich in their color tones, were restricted to buildings used for religious purposes. These are found in the myriad pagodas and temples and often are strikingly beautiful. They were not allowed in buildings erected by the common people nor for the homes of even the rich. Green glazed tile were made for and used as the distinguishing mark of the homes of the wealthier classes while the common people used in constructing their houses a soft-burned rough brick wholly without glazing.

Long ago the Chinese mastered the secrets of terra cotta manufacture and it was made in a wide variety of intricate patterns of all colors. It was used generally for ornamental purposes, around doors and windows and for openings in the walls about the gardens for which the Chinese have long been famous. With a complete mastery of porcelain manufacture the making of brick, tile and terra cotta was an easy task for the Chinese even centuries ago.

Today the Chinese use a variety of methods of brick manufacture and probably are not as expert as they were four or five hundred years ago. Certainly they do not produce the high quality of material they did in those far-gone days. In some sections they still make a sun-dried brick of mud and crushed rice straw which is used for the homes of the very poor classes. These are even more massive than the giant bricks in the great wall, being 12 inches square and 18 inches long. They are laid up and plastered on the outside.

Fire-burned brick are usually 2x5x10 inches and range in colors from red to black, depending upon the quality and ingredients of the clay. Mostly they are hand made, manual labor being cheaper in China today than machinery. The best quality Chinese brick at present is made near Shanghai. It is hard burned and resembles the English brick more than any American product, being larger in all dimensions. A French type of tile is also

made in that locality being red or brown in color and well burned.

In their construction the Chinese make free and understanding use of all clay products. Hollow walls are to them an old story. They have built them for centuries and build them to day. The Chinese method is to lay alternate courses flatly and on edge. The runners, which are laid on edge are generally either 2x5x10 inches, or 2x4x8 inches, and the headers 1x5x10 inches. These headers, which lie flat in the wall, tie the two veneers of the wall together with exceptional firmness. Either size of brick works out to advantage and the walls vary in appearance according to which is used.

In substituting terra cotta tracery and patternwork for ironwork in porch railings and for stairways the Chinese have developed a singular adeptness of manufacture. The terra cotta is burned in glazed colors, made in units and is locked together with either dowels or lime mortar. Usually the units are set into the brickwork further to hold it firmly in place. The effect is oddly pleasing and the cost about the same.

Chinese architectural ideas vary radically from our own. Apartment houses, for instance, instead of having basements with storage rooms and laundries therein, provide these on the roofs. And when one considers the contrast, with light and cleanliness and lack of rats and roaches and all else that goes with too many American apartment basements, the Chinese seem to have all the best of the argument.

Many schools and public buildings have unplastered brick interior walls, the Chinese holding that plastered walls absorb dampness and are therefore undesirable from both a sanitary and health viewpoint.

Concrete is coming into rather extensive use in Chinese construction, more for interior reinforced columns and floors than for exterior walls. The Chinese has been too long wedded to brickwork to surrender easily this preference. Occasionally there is a use of stone for trim about windows and doors, but more often

this is of terra cotta. Tile predominates for roofs in the better construction.

Some of the best remaining examples of ancient Chinese masonry are found in the old temples and pagodas. This frequently compares well with that of the royal palaces.

Generally pagodas are solid with the exception of the interior stairways. Climbing to the top of one of them has a religious significance akin to the Moslem's pilgrimage to Mecca. One mounts the interior stairway to come out on the cornice of the next story which he must circle on the outside until he finds the opening to the next stairway. This performance must be repeated until the top is reached. If you manage to do the trick and come off alive you are supposed to have good luck forever afterwards.

The minaret on top of the pagoda is usually supposed to house some sacred relics of Buddha, but as it likewise is solidly built, one has to take this on trust. The tile roofs are generally laid in mud and in this instance the foliage about the top is growth from seeds which have been carried there by birds. It is mostly grasses and small fruiting shrubs. The same conditions are noticeable on several of the lower cornices. This particular pagoda is centuries old. In it the brickwork is little changed in bond from what is in general use today.

Most of the modern Chinese buildings, the missions, schools, dormitories, and residential structures for the attaches thereof, have been markedly influenced by the architecture of America and Europe. Some of them might easily be mistaken for structures from either continent. Chinese architects and builders, in the larger cities particularly, are slowly breaking away from the methods of their ancestors. More and more their designs are taking on a Western atmosphere, still, in every instance, there remains something of the unmistakable Chinese touch.—*Building Economy*.

BUILD AGAINST FIRE

By W. E. MALLALIEU, *General Manager,
The National Board of Fire
Underwriters.*

Engineers who have made an exhaustive study of the problem have a positive answer to the question, "How can we curtail America's stupendous fire waste?" They say with distinct emphasis, "The loss can be reduced *if we will build to resist fire.*"

The initial step in building to resist fire is to have the plans drawn by an architect who understands the principles of fire prevention. Of necessity the structure must be erected in accordance with the plans and specifications and it follows that if the plans are right the finished building will be fire-safe. *Many a building has been saved from fire while the plans were on the drafting board!* The modern structures we now see in our cities are the result of many improvements and safeguards in the building industry.

In these large modern structures it is well to build so that there will be no great open areas through which fire can sweep unretarded. So far as possible fire-resistive material should be used throughout. In order to be fire-safe this type of building must be able to resist fire both from within and from without. One of the elementary rules is to build so that the flames will be confined to the place of

origin until the fire department can arrive and extinguish the blaze. It is therefore imperative that stairways and elevator shafts be enclosed and fire doors installed to separate the various sections of the structure. There should be no way for fire to spread from one floor to another. Often a building that would resist fire originating within its own walls would be an easy prey to fire starting in an adjoining structure. Many so-called "fireproof" buildings are exposed to danger by adjacent structures. In order to resist fire from the outside, windows may be equipped with wired glass in metal frames. Another important element making for fire-safety is the installation of a complete equipment of extinguishing devices such as automatic sprinklers, standpipes and fire extinguishers.

A larger percentage of combustible material generally enters into the construction of dwellings than in the type of building just discussed. However, if due consideration is given to fire-resistive construction, even a dwelling can be made relatively fire-safe. A fire in the average American home spreads very rapidly and it is vastly important to build so that the flames may be confined to the place of origin. Fire-stops which will retard the spread of fire from one floor to another are exceedingly important. A fire-resistive roof also aids materially in making

dwellings fire-safe. When a heating plant is installed, due care should be taken to protect all combustible material from contact with parts of the equipment that will become hot, and all electrical work should be done in accordance with the electrical code. Chimneys also cause a large amount of fire waste annually, which could be prevented if they were built in accordance with standard specifications.

If one considers that the loss from fire ever year is a half billion dollars the importance of building to resist fire will be recognized, especially when it is realized that material destroyed in this way can not be replaced and constitutes a severe drain upon the economic sources of the nation.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

Many a man would do a better job if he didn't know about putty.—Ex.

American
Fire and Marine
Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

"ANTI-HYDRO" Keeps These Cellars Permanently Dry

One of a Group of Houses at Malba Estate
Malba, Long Island, N. Y.

Architect, Harold E. Padden
Contractor, Arthur Waldron

The houses at Malba Estate are built on "springy" ground, but the cellars of all of them are always dry, because the concrete foundations, walls and floors are permanently waterproofed with "ANTI-HYDRO."

No matter how large or small your job may be, you will find "ANTI-HYDRO" the most satisfactory as well as the most economical concrete waterproofer and hardener you can use. It both hardens and waterproofs in *one operation*.

"ANTI-HYDRO" is a liquid integral compound which mixes easily with the gauging water—any unskilled laborer can do it. Twenty-five years of successful use is your guarantee of satisfaction when you use "ANTI-HYDRO." Try it on your next job for permanence.

A Better Service for

**BUILDING MATERIALS
LIME PRODUCTS
SAND AND GRAVEL**

THE enlarged Warner Company (formerly Charles Warner Company), has acquired the business and properties of The Van Sciver Corporation.

Instead of wasteful duplication of effort and facilities, the Warner Company by this acquisition, will be able to effect material economies, particularly in the transportation and distribution of Building Supplies in metropolitan Philadelphia.

The enlarged Warner Company will have as its objective the constant betterment of its service and the continuance of the reputation of both predecessor companies for quality products.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

METALWELD, Inc.

26th and Hunting Park Avenue, Philadelphia

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Consolidated School, Duncannon, Pa. Contract awarded Hampton, Snyder & Seeds, New Bloomfield, Pa. Heating to J. C. Bowman, Penbrook, Harrisburg, Pa. Plumbing, J. H. Geiger, Duncannon, Pa. Electric, J. L. Crumm, Penbrook, Harrisburg, Pa. Architects, Kast & Kelker, 222 Market street, Harrisburg, Pa. Owners, Penn Township School Board, J. G. Mutzabaugh, Duncannon. Brick, 1 story and basement, 120x60 feet, Barrett roof, yellow pine and oak floors, roof ventilators, electric light, metal lath, bond.

Church, Shoemakerville, Pa. Contract awarded Wheeler & Stitzel, Shoemakerville, Pa. Architect, W. Marshall Hughes, 147 North Fifth street, Reading, Pa. Owners, St. Luke's Union Church, R. Wolf, Shoemakerville, Pa. Stone, steel, 1 story and basement, 128x40 feet, slate roof, oak floors, vapor heat, electric work, metal lath, steel sash, iron pipe, waterproofing, bronze work, bond.

Science Building, Reading, Pa. Contract awarded J. C. Dethoff, 1600 Hampden Boulevard, Reading, Pa. Plumbing and heating to Wasner & Reddig, 206 North Sixth street, Reading, Pa. Electric to George Anspach, Reading, Pa. Architects, Muhlenberg Brothers, 115 South Fourth street, Reading, Pa. Owners, Albright College, Rev. W. T. Teel, president, Thirteenth and Exeter streets, Reading, Pa. Stone, steel, 2 stories, 120x57 feet, 21x29 feet, slate roof, wood and composition floors, roof ventilators, electric work, tile, marble.

Garage, Clifton Heights, Pa. Contract awarded John Schnabel, Thirteenth and Chestnut streets, Philadelphia. Architect, Herman Miller, Crozer Building, Philadelphia. Owner, Albert H. Bien, Clifton Heights, Pa. Brick, steel, 1 story, 30x35 feet (plumbing, heating, electric reserved), slag roof, cement floors, rolled steel sash.

Residences (3), **Residences (2)**, Elkins Park, Pa. Architect, private plans. Owner, Stanley M. Getz, 6730 York road, Philadelphia. (3) Stone, brick, concrete block, 2½ stories, 26x50 feet (2), 26x60 feet (1). (2) Stone, 2½ stories, 30x70 feet, hot water heat, electric light, tile work, hardwood floors, garage in basement. Owner taking sub-bids on first three residences. Contract awarded to E. J. Heinke, 505 Church road, Philadelphia. Contract on 2 residences awarded to E. J. Heinke, 505 Church road, who will build in the fall.

Residence and Garage, St. Davids, Pa. Contract awarded Powell Construction Co., Ardmore, Pa., who is taking sub-bids. Architect, private plans. Owner, John W. Klenn, St. Davids, Pa. Stone, frame, 2½ stories and basement, 40x26 feet, garage, 1 story, 18x18 feet, shingle roof, oak, pine and cement floors, hot water heat, electric light.

Duplex Residences, Huntingdon, Pa. Contract awarded Berkebile Brothers, Johnstown, Pa. Architect, G. Edwin Brumbaugh, Real Estate Trust Building, Philadelphia. Owners, Juniata College, Huntingdon, Pa. Brick, 2½ stories, L shape, 25x69 feet, wing 25x29 feet, slate roof, oak and pine floors, plumbing, hot water heat, electric light, slate roof, oak and pine floors, plumbing, hot water heat, electric light, tile.

Bank Building (alts.), \$125,000. High and Hanover streets, Pottstown, Pa. Contract awarded F. H. Keiser & Co., Pottstown, Pa. Architects, MacKenzie & Wiley, Bankers' Trust Building, Philadelphia. Owners, Security Trust Company, Dr. J. Elmer Potter, Pottstown, Pa. Stone, brick, steel, 1 story and basement, new front, general interior alterations.

Residence and Garage, Hilltop, Merion, Pa. Contract awarded to Raymond L. J. Riling, 1425 West Venango street. Architect, Richard W. McCaskey, Otis Building, Philadelphia. Owner, William J. Cahill, care of Chandler & Rankin, Packard Building, Philadelphia. Brick, 2½ stories.

Residence and Garage, Baltimore and Riverview streets, Swarthmore, Pa. Architect, J. Liner Conarroe, 1518 Walnut street, Philadelphia. Contract awarded F. K. Worley Construction Co., Wesley Building, Philadelphia. Owner, Charles Andes, care of architect. Brick, frame, 2½ stories and basement, 70x25 feet, shingle roof, oak and pine floors, tile work.

Residence, Lancaster, Pa. Contract awarded W. B. Aierstuck, 34 East Chestnut street, Lancaster, Pa. Architect, M. R. Evans, 10 South Queen street, Lancaster, Pa. Owner, George Arisman, 77 Spencer avenue, Lancaster, Pa. Brick, 2½ stories, 41x70 feet, shingle roof, hardwood and linoleum floors, hot water heat, electric light, tile work.

Residence, Lancaster, Pa. Contract awarded Edward Brenner, Millersville, Pa. Architect, H. Y. Shaub, 20½ North Queen street, Lancaster, Pa. Owner, D. Davidson, care of architect. Stone, 1½ stories, 28x45 feet, shingle roof, hardwood floors, hot water heat, electric light, oil burners, tile work, flagstone.

Store and Apartment, Ardmore, Pa. Contract awarded J. L. Fawley, 2121 Walnut street, Philadelphia. Architects, Silverman & Levy, Thirteenth and Chestnut streets, Philadelphia. Owners, Mastbaum Brothers & Fleisher, 1420 South Penn Square, Philadelphia. Brick, steel, 3 stories and basement, 16x85 feet, slag roof, oak, pine, cement floors, metal lath, tile work, bond, ornamental iron work.

Municipal Fire Alarm Headquarters, Electric Light Plant and Garage, Lafayette and Water streets, Norristown, Pa. Contract tentatively awarded to Hood & Gross, 1535 Chestnut street, Philadelphia, \$61,975. Plumbing, F. H. Boyer, Norristown, Pa. Pending third meeting of Council to be held May 21st. Architect, H. Gordon McMurtrie, 1321 Arch street, Philadelphia. Owners, Borough of Norristown, C. R. Palmer, Norristown, Pa. Brick, 1 and 2 stories, 70x186 feet, built-up roof, reinforced concrete.

Stores (2), 216-18 Ardmore avenue, Ardmore, Pa. Contract awarded F. H. Wilson, Ardmore, Pa. Architects, Sundt & Wenner, 1701 Arch street, Philadelphia. Owner, Joseph Delgesse, 33 Greenfield avenue, Ardmore, Pa. Brick, reinforced concrete block, 1 story, 37x36 feet, slag roof, pine floors, hot water heat, electric light, metal ceilings, plate glass, copper.

Media Inn and Restaurant, Baltimore pike and Providence road, Media, Pa. Contract awarded E. K. North, Media, Pa. Architect, E. Kenny Crothers, Media, Pa. Owner, H. J. Patton, Media, Pa. Brick, frame, stucco, 3 stories, 47x36 feet, 36x25 feet, wing 37x37 feet, excavation, brick work, casement sash (Lupton or equal), ornamental iron work, Massell steel joist (Laub), oak and pine floors, screen, dumb waiter (Little Beauty), metal lath, plastering, plate glass, rubber tile (U. S. Rubber Co.), insulite floors, tile floors, slate roof, electric work, plumbing, steam heat.

Schools (5), Ardmore, Cynwyd, Ashland, Pa. Contracts awarded. Architects, Savery & Scheetz, Stephen Girard Building, Philadelphia. Owners, School District of Lower Merion, W. L. Austin, Ardmore, Pa. Vocational School, Ardmore, Pa., Bowden Construction Co., 1607 Summer street, Philadelphia, \$33,090. Junior High School, Ardmore, Pa., Hood & Gross, 1535 Chestnut street, Philadelphia, \$3,120. Senior High School, Ardmore, Pa., Hood & Gross, 1535 Chestnut street, Philadelphia, \$2,939. Cynwyd School, Hood & Gross, 1535 Chestnut street, Philadelphia, \$492. Ashland School, Bowden Construction Co., 1607 Summer street, Philadelphia, \$1,300.

Reconstruction to School, Edgemont avenue, Parkside, Pa. Contract awarded Nichols & Beckett, Glenolden, Pa., \$12,890. Plumbing, L. Hand, Parkside, Pa., \$6,025. Heating, American Heating & Ventilating Co., Schaff Building, Philadelphia, \$4,750. Electric, George Wood, Chester, Pa., \$550.

Kelleyville Bridge, No. 71, between Clifton Heights and Darby, Pa. Contract awarded C. R. Camp, 10 South Eighteenth street, Philadelphia, \$34 cubic yard. Owners, Delaware County Commissioners, G. T. Wades, Media, Pa. Pouring a 12-inch wide skirting entire length, both abutments, around all piers, together with underpinning of same, 1:2:4 concrete.

Storm Sewer, Marcus Hook, Pa. Contract on gutters awarded Walter I. Newton, Newark, Del., \$2,720. Sewers awarded to T. A. Riley, 12 Rainey street, Chester, Pa. Assistant engineer, Chester S. Baker, Chester, Pa. Owners, Borough of Marcus Hook, C. R. Renni, Marcus Hook, Pa.

Sanitary Sewer, Upper Darby, Pa. Contract awarded Delaware Construction Co., Clifton Heights, Pa., \$7,462.91. Engineers, Damon & Foster, Sharon Hill, Pa. Owners, Township Committee, T. C. Kelly, Upper Darby, Pa. 15-inch and 18-inch sanitary sewer, Roberts avenue, Dermond avenue.

Curbs and Gutters, Darby Township, Pa. Contract awarded Ramsdell Construction Co., Upper Darby, Pa. Owners, Delaware County Commissioners, G. T. Wades, Media, Pa. 189 lineal feet standard curb and gutters.

Road Work, Pennsylvania. Owners, Pennsylvania Department of Highways, James L. Stuart, secretary, Harrisburg, Pa. Contracts awarded.

Pike County, A-5782, Delaware Township. Bituminous treated macadam surface course. Burgess Brothers & Henry, Fork Union, Pa., \$53,705.50.

Columbia County, R-183, A-5078, Locust Township. One course reinforced concrete. Colonial Construction Co., Pittsburgh, Pa., \$85,095.32.

Church, Wallingford, Pa. Contract awarded Wm. Provost, Jr., Chester, Pa. Architect, Savery & Scheetz, Stephen Girard Bldg., Philadelphia. Owner, Wallingford Presbyterian Church, Wallingford, Pa. Stone, 1½ stories and basement, irregular in size, slate roof, maple and cements floors, steam heat, electric light, metal lath, tile work.

Residence and Garage, Bryn Mawr, Pa. Contract awarded Unkerfer Bros., Otis Bldg., Philadelphia. Owner, name withheld. Architect, Ralph L. Colton, 1520 Locust street, Philadelphia. Stone, frame, 2½ stories, 30x60 feet, shingle roof, hardwood floors, hot water, gas heating, electric light, tile work.

Residence (alts. and add.), Doylestown, Pa. Contract awarded J. S. Bailey & Bro., Doylestown, Pa. Architect, A. Oscar Martin, Doylestown, Pa. Owner, Dr. A. H. Moore, Doylestown, Pa. Brick, concrete block, 2 stories, 14x36 feet, tile work, tin roof, electric light, metal sash.

Store and Apartment, Penn street, Reading, Pa. Contract awarded Fink Construction Co.,

510 Walnut street, Reading, Pa. Plumbing, Walter H. Fritz, 725 Penn avenue, West Reading, Pa. Heating, Walter H. Fritz, 725 Penn avenue, West Reading, Pa. Electric, Stitzer & Waldman, 528 Penn avenue, West Reading, Pa. Architects, Muhlenberg Bros., 113A South Fourth street, Reading, Pa. Owners, Alick Salon, Sixth avenue and Penn avenue, West Reading, Pa. Brick, steel, concrete, 2 stories and basement, 150x44 feet, composition roof, concrete and maple floors, waterproofing, cut stone, incinerators, casement windows, asbestos tile wall, metal lath, tile work.

Residence, Reseto, Pa. Contract awarded Eugene Rissmiller, Pen Argyl, Pa. Architect, C. J. Young, 226 North 6th St., Reading, Pa. Owner, Anthony D. Sabatino, Roseto, Pa. Brick, 2 stories, 28x2 feet, slate roof, hardwood floors, vapor heat, electric light, metal lath, casement windows.

New Jersey Construction News

State Street Bridge (restoration), \$33,000. Camden, N. J. Plans in progress. Engineer, Beale H. Smuckers, Camden, N. J. Owner, Board of Freeholders, Camden, N. J.

Apartment House and Hotel, Boardwalk, Atlantic City, N. J. Tentative plans drawn. Work contemplated. Architect, Frank E. Hahn, 629 Chestnut street, Philadelphia. Owner, name withheld. Brick, steel, stone, concrete, 15 stories, 84 housekeeping apartments, 250 rooms.

Sewage Plant, \$250,000. Shelter Island, Ventnor, N. J. Plans almost completed. Owners will be ready for bids about August. Engineer, Clyde Potts, 30 Church street, New York City. Owners, City of Ventnor and City of Margate, care of Isaac B. Sweigart, Mayor of Ventnor, Ventnor City, N. J.

Residence, Pennsgrove, N. J. Architect ready for bids. Architect, C. R. Hope, Dupont Building, Wilmington, Del. Owner, Fred Gentieu, Pennsgrove, N. J. Brick, 3 stories, 40x40 feet, shingle roof, oak and tile floors, tile work, electric light.

School Building No. 4 (add.), Woodbury, N. J. Low bidders. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, Board of Education, North Broad street, Woodbury, N. J. AS THE EDITOR SEES IT

The position occupied by general contractors during the past 15 years has been similar to that of a beleaguered garrison, claimed Thomas T. Flagler, Atlanta, Ga., in a president's message to the Associated General Contractors.

Beset on all sides by uneconomic business customs and methods, unwise statutes that promote loose credit conditions and short sighted practices in the letting of contracts, the mortality among contracting firms has been high, pointed out president Flagler in detailing the high points of the program to be placed before the executive board of the contractors' association at Oklahoma City, May 16.

Plans for the remedying of the basic difficulties in the construction industry have not only been formulated but have been applied far enough to show their value in specific localities. Loose credit practices that result in staggering losses to material dealers, in unpaid accounts and which not infrequently subject owners to demands for dual payment on materials through the operation of lien laws, can be remedied through the credit plan which is to be a principle point for discussion by the Oklahoma City meeting, it was claimed. The purpose of again bringing this plan up on May 16, is to further devise ways and means to get it into operation in every community in the nation.

General contractors are interested in remedying loose credit conditions that work a hardship on material men, subcontractors and owners, it was explained by president Flagler, because those conditions are one of the roots of the irresponsible competition which make sound business policies difficult for general contractors to pursue successfully.

The essence of the plan is to arrange for the gathering and proper dissemination of information on the credit standing of every contractor in a community. Such procedure has long been established practice in many other industries but the credit of contractors has never been subjected to similar analysis.

Risks taken by those contractors who are bears on the construction material

markets have been greatly increased during the past three months according to a statistical study just completed by the Associated General Contractors of America.

The occasional practice of contractors who discount their bid prices in the expectation of riding through to a final profit depends on the anxiety of subcontractors and material men to find an outlet for their services and products. This has frequently been shown to be bad business, it was announced by the association.

The figure for prices paid for building materials rose one point in February to index number 89. That gain was held in March, and during April advanced another point to index 190. The comparison is with a base figure of 100 prevailing in 1913.

The actual costs of construction were not materially affected by this latter movement for costs remained level during April at index 204, according to this study.

The manner in which unethical or irresponsible contractors gambled in futures was through cutting bid prices down to the point where they were assured of being low bidders on new projects. By playing one anxious seller of material or service against another the attempt is then made to pass along the effect of these low bid prices.

It was also explained that the quality of work that is given the owner seldom interests those who supply the cut price jobs.

A plan to aid public officials and private owners in avoiding the experience of having a contractor default on contract work before the completion of a project will be discussed at the meeting of the Executive Board of The Associated General Contractors in Oklahoma City, May 16.

This was announced by S. M. Williams, manager of the Engineering Construction Division of the contractors' association. It was made regarding the recent establishment of a basis for co-operation between general contractors and those bonding companies that underwrite surety bonds guaranteeing contract performance.

The plan involves establishing the means to gather information on how contractors have performed their contract obligations in past dealings and when fully operating, it is claimed, will make available an exact picture of the facts to the surety companies when considering any application for a surety bond.

This plan is the outgrowth of six years of discussion with surety companies and was only advanced toward concrete establishment last January 31, after both organized contractors and the surety companies got together in a bureau set up for co-operative effort.

All details of the plan have been worked out and it is expected that actual work on the listing of contract performance data will begin after meetings on May 16 in Oklahoma City and on June 4 in New York.

At the Oklahoma City gathering, general contractors through their association will be called upon to approve the final details of the plan which will then be presented in New York to the surety companies. Both groups have already approved of the plan in principle but have not examined the details worked out for its application.

Advantages accruing to building and allied trades by the use of concise, enforceable arbitration clauses in their contracts were grouped under six heads by L. K. Comstock, prominent New York builder at the Indianapolis Building Congress recently. Mr. Comstock is Chairman of the Finance Committee and a Director of the American Arbitration Association, as well as Chairman of the Arbitration Committee of the New York Building Congress. His active participation in the promotion of arbitration has made him one of the most quoted figures on that subject in the building world.

1. Arbitration conserves friendly relations.

"It is trite to say that a lawsuit is a battle, often more a campaign than a single engagement," said Mr. Comstock, "degenerating into the situation where the parties seek to do each other the greatest possible injury, regardless of individual benefits. Not so with arbitration. Where there is a submission made after the dispute arises the parties have voluntarily adopted the new type of judicial procedure, for arbitration deserves to be so understood. They seek a speedy and just determination with minds prepared to accept the decision and to conform to it. And when arbitration follows as the result of an agreement made before a controversy has developed there is even less opportunity for hard feelings to arise."

2. Arbitration is private—

"The unavoidable publicity of a trial court is in many instances a cause for grievance," declared Mr. Comstock. "Parties are often unwilling to disclose their private affairs in the presence of trade rivals and curious spectators. Nothing is gained by this notoriety. In arbitration there is a minimum of embarrassment in this way."

3. Arbitration Affords Expert Adjudication—

"Business has always been technical," he continued, "and more or less a law to itself. When disputes involving business custom—and they are numerous—get into court by jury, the necessity exists not merely of proving the case, but of educating the jury to the point of understanding the relevancy of the facts. By expert witnesses under rules of evidence this education is accomplished in a most tedious and awkward manner. Ordinarily a majority of the jury are actually disqualified in mentality or experience to grasp the situation."

"Arbitrators, if wisely selected are well versed in the technicalities and terminology of the industry and otherwise well qualified by temperament and training to hear disputes and render impartial judgments."

4. Arbitration Dignifies the Parties.

"Juries are unfitted," he held, "for making expert discriminations and their verdicts can not be expected to compete for accuracy with the award of an arbitrator well versed in the intricacies of business custom. The tactics commonly considered necessary in trying cases before juries are unknown in arbitrations. The appeal to emotion becomes ridiculous. The amenities of business are conserved."

Arbitration Saves Time—

"Time may be saved in two important ways"; he said, "first, in securing final determinations more speedily than is possible in most courts, and secondly, in reducing the time actually devoted to the trial."

"Court trials can never achieve the flexibility which is inherent in arbitration. A hearing set by an arbitrator is not at the mercy of other like proceedings. It can begin on the minute. It has the right of way. Witnesses lose a minimum of time. Adjournments can be made to meet the convenience of all concerned."

6. Arbitration is Cheaper.

"The poor man has a chance," he concluded. "It's an old phrase of the English Common Law that every man is entitled to his day in court. It is a well known fact that the poor man's day in court isn't worth much to him, because

his financially stronger opponent can fatigue him into submission; because he cannot afford the necessary time. But arbitration is both speedy and economical and every man who has a commercial dispute can afford both the time and the money to arbitrate. The only known alternative to a law suit, or acceptance by duress, is arbitration under the auspices of an established and recognized institution with proper arbitral facilities. Arbitration is more economical than any other means of settling commercial disputes."

WE ASK YOU

Isn't it funny?
THAT A MAN WHO CONSIDERS
HIMSELF A BUSINESS MAN
Will get up in the morning
From an advertised mattress,
And put on advertised underwear,
Advertised hose, shirt, collar, tie and shoes.
Beat himself at a table and
Eat advertised breakfast food,
Drink advertised coffee or substitute,
Put on an advertised hat,
Light an advertised cigar,
Go to his place of business and
TURN DOWN ADVERTISING ON THE
GROUND THAT ADVERTISING DOESN'T
PAY!

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

PHILADELPHIA

and the

write practically every form of Insurance, except life*

Never a
Drop of
Water
in this
Basement

It's Waterproofed with "ANTI-HYDRO"

The concrete basement in this building had to be absolutely dry because it contained a restaurant, also the equipment and storage rooms for the theater.

In order to eliminate the slightest possibility of dampness the entire basement was waterproofed with a plaster coat mixed with "ANTI-HYDRO." It is permanently dry and free from the slightest suggestion of moisture.

You will find "ANTI-HYDRO" extremely easy to use. Being a liquid integral compound it mixes easily with water without the aid of skilled labor. It waterproofs, hardens and dustproofs concrete in one operation—accelerates the set of concrete, increases its strength and actually saves you money.

For 25 years "ANTI-HYDRO" has proved its merits on every type of concrete work. Results are guaranteed permanent. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

WHAT'S WRONG WITH BUILDING MATERIAL ADVERTISING?

Constructive Advice for Those Who Are Seeking a Market for Any Product That Enters into Building Operations

BY ALFRED E. FOUNTAIN, JR.
Of Lyddon, Hanford & Kimball, Inc.

One great trouble with building material advertising is the unbalanced appropriation. By unbalanced appropriation, I mean one that does not recognize the relative importance of the various buying factors and consequently does not place the stress on the points that warrant it. This lack of balance is the result of an incomplete realization of what the sale of a building material means, what sort of individuals the buying factors are, how they think, how they react to advertising and why.

There are any number of manufacturers spending their entire advertising appropriations on the owner and completely ignoring both the architect and the contractor. There are others who, while recognizing both architect and contractor, apparently begrudge every dollar spent on them, and end up by using consumer copy in architectural and building trade publications. Yet, if the compilers of these appropriations would only take a little time to review the history of the industry and then consult with a few architects and builders, they would soon see what a fallacy this is.

I don't mean to underestimate the importance of the owner in the buying chain, nor do I want to overemphasize the architect and the builder. But the point I now claim and then hope to prove is that both architect and builder (I include both general and sub-contractor) are tremendously influential when it comes to determining what materials shall go into a building and, because of the peculiar structure of the industry, will always remain so.

Perhaps the best way to make this point clear is to outline first a few of the reasons for the seemingly contradictory conditions that one meets throughout the industry; then to indicate the different points of view of the three important buying factors.

Up to within thirty years ago building could hardly be spoken of as an industry in the national sense. There was in fact a group of industries, set apart by distance limitations and territorial customs, each functioning as a separate and self-contained unit in a manner best adapted to its own peculiar location.

Then came the breaking down of distance barriers and the change of outlook in all American industry with the inten-

sive sales and manufacturing methods of modern business which took this sleeping giant from the quiet streams of local enterprise and thrust him into the whirlpool of national selling. The change came so quickly that neither the personnel nor the methods of distribution have as yet been able entirely to adjust themselves.

Innovations Are Accepted Slowly

It must also be borne in mind, when viewing the seemingly complex situation that faces the national distributor of building materials, that this is the second oldest industry (food supply probably being older), and is steeped in tradition. Success in it is founded on accuracy of performance. Mistakes are costly. Consequently within the industry, innovations are accepted slowly and with caution, final acceptance coming only after repeated successful trials.

It being quite obvious that before a manufacturer can advertise and sell on a national scale he must have national distribution, the manufacturer of building materials finds himself confronted with many problems before he can adjust his product so that it has a truly national appeal.

We have, first off, climatic differences and differences in habit. It is rather difficult to sell heating systems in Florida, or wood siding, roofing and insulating material in California, when there is a predilection there for cement construction. It is also difficult to sell brass pipe in certain territories or limestone in New England where local pride demands marble or granite.

We have freight limitations. The Eastern manufacturer of bulky clay products finds it almost impossible to compete in the midwest market. This in fact is a difficulty that will keep many industries from ever becoming national advertisers unless they manufacture in more than one place or advertise as associations.

There are also local building laws that make it well nigh impossible to sell certain products on a national scale. This difficulty of course can and will be rectified although I don't think inflammable materials will ever be widely sold in urban centers.

So, while there are many kinds of buildings that are cut to a pattern, so to speak, and, in the main, are the same the country over—movie theaters, schools and the like—you can readily see that before the building material manufacturer can advertise economically on what we term a national scale, he has to adjust his product to meet some widely different conditions.

There is one thing sure, however. The manufacturer with a product of merit has before him a tremendous and growing market. It is a market in which well-planned advertising pays. There is not an outstanding success in the entire building industry that has not been predicated on advertising that understands the markets and that has been first budgeted in relation to the importance of the buying factors of the markets and then addressed to each as a separate individual.

I know of no other industry in which the individuals making up the buying factors are so clearly and distinctly grouped as in the building industry; who are so limited as to numbers and yet who control such tremendous expenditures; who are so permanently located and get-at-able that advertising waste can be reduced to a minimum; who work so closely in harmony of effort, yet talk such different languages and re-act to such different sales methods. There are four important buying factors—the owner, the architect, and the contractor and material dealer.

The Owner

Unless the building material manufacturer has a commodity of general appeal widely distributed through an organ-

ization truly national in its scope, the problem of economic advertising to the owner or in other words the general public is a serious one. He has first to realize that the public of the building industry is in no sense the same as the public of other lines. People build buildings more seriously and cautiously than most anything else they do. They are seldom swayed by the impulse of the moment, but buy only after careful study and thought. They buy from a myriad of personal motives. They want practicability as they personally see it and are not always influenced by the lowest price.

Then there are several kinds of prospective owners each influenced and biased from different motives. There is the owner about to build a home—his dream house to live in forever. If in his mind's eye, he sees a white shingled cottage, try to sell him a stucco house!

There is the realty owner or merchant builder who erects houses to sell for profit. It doesn't take much deduction to see that he must be approached from a very different angle from that used for the owner who builds to keep.

There is the industrial owner—the corporation that, to produce profits, builds factories, warehouses, banks, theatres, etc. There is the institutional owner who controls the erection of schools, hospitals and the like—one of the greatest and most clearly defined of all of the groups.

And also there is the Government owner who builds public buildings of many kinds.

Each one of these various groups of owner individuals has to be sold from a different angle, if it is to be sold at all. Each owner is biased and urged forward or held back by his personal likes and dislikes, by his financial condition, geographic location, or purpose for which his building is intended. All of which makes a perfectly amazing chaos when analyzed and studied for an advertising campaign.

How then, you ask, can the manufacturer of modest means step into the realm of advertising and be sure that he will not waste his appropriation on this truly chaotic market we call the Owner?

Right here is where the unbalanced advertising budget can be avoided by realizing the one outstanding difference between building trades selling and all other selling. In the building industry there is a comparatively small group of individuals which exercises such a tremendous influence over the selection and use of materials that they can be said to be the dominant purchasing power of the industry. I refer here to the architect, contractor and sub-contractor.

I do not infer that this group wields an arbitrary power and is the *whole* show when it comes to the purchasing of materials, for after all its members are employed to serve. But they are also em-

ployed because of their expert knowledge of building; their word carries weight and in the last analysis they are in a position very nearly to kill the sale of any material in which they do not believe.

Those of you who have employed architects or contractors know of the constant pressure and vigilance these trained men maintain to keep you within the bounds of practicability and economy. And parenthetically, let me warn you that if you feel the urge to build coming on, be sure to engage the services of the best architectural and construction talent that you can afford. I have recently completed a summer home on rather an air tight budget and after the most careful planning and scheming on my own part, I employed both a competent architect and builder to save money for me, and they did it.

With all the owner's knowledge of materials, the architect and the builder are still the ones upon whom depend the economic and practical success of any building.

All of which being accepted as true, it is easy to see the economic fallacy of making the owner the over-dominant note in a building material campaign. It means first the tremendous cost of getting all owners under the spell of the advertising and then the danger of having it upset by not having properly sold the architect and contractor.

The Architect

It has been claimed that the architect as a class either directly specifies or influences the specification of 80 per cent. of all building materials. There are some who will claim that it is an over-optimistic estimate. I am inclined to believe it substantially correct for careful estimates credit architects with specifying one hundred and fifty million dollars worth of materials every month, or nearly two billions a year, out of a total of over three billion dollars expended annually for building materials and equipment.

Beyond this direct specification of materials there is the tremendous influence of architect-chosen materials in construction over which architects have no direct control—such as small private houses on which no architect is employed and industrial work designed by engineers. And now, with the increasing appreciation for the esthetic in construction, the architect's influence will increase rather than diminish. I believe that our buildings of tomorrow will be entirely designed and decorated by architecturally trained minds.

The interesting thing about architects, from the viewpoint of the seller of building materials, is the fact that there are so few of them. Information from many different sources reveals the astonishing

fact that there are not over 10,000 architectural offices in the entire country and that not over 20,000 men are employed by these offices.

Here then is a relatively small group of individuals either directly controlling or influencing the specification of a major part of all building material. And this group is so compact, exactly located, similar in outlook, ideals and aims that it can be studied as a group and advertised to as a group.

Does it not seem logical that from the viewpoint of sheer economics, the architect is entitled to a more important place in the advertising budget than he usually gets?

The Contractor and the Material Dealer

Contractors and material dealers constitute a group of less than 200,000 recognized and established concerns whose importance in the selection of building materials it is dangerous to discount. While primarily they function as middle-men or purveyors of material, they are the practical field men of the industry. While an owner may know, even in considerable detail, what he wants in the way of construction, and the architect may be able to interpret that need both practically and esthetically, it is the contractor who must put it in terms of actual construction. Thus, in most architectural offices, it is the usual practice to consult with friendly contractors about the practical details of construction.

It is right at this point that most successful manufacturers of building materials make their most effective sales efforts. Many of them do their own erection or control it through close relationship with contractors and it is as *experts* in construction that they are consulted by architects and owners about the practical details of their work.

To sum up the whole situation, it seems to me that when advertising programs for building materials are being made, it would be economically sound to consider each and every purchasing influence and place it in its relative position and work it for all that it is worth. It is true that

the order of importance of the various influences will vary with different products. In the case of entirely decorative material, such as wall covering or lighting fixtures, the owner will probably be more important than the architect. But in the selection of rough structural materials and in many of the finished structural products, such as roofing, floors, etc., the architect's influence will be very great.

Each year the individual advertiser is confronted with the problem of selling over a half million new owners who come into the market. Besides this, he must either sell or keep sold the many millions who are already owners and present a tremendous replacement market. As I have indicated, this vast group is in reality not a group, but a tremendous number of individuals who present an imposing problem to the limited budget.

Against this, the advertiser has a small group of architects, contractors and dealers, mostly actuated by similar impulses, whom he can easily turn into salesmen for himself.

I have seen many small appropriations produce wonderful successes because of a careful study and analysis of the relative importance of the various buying influences has been made. And I have seen great appropriations turn into dismal failures.

The building material manufacturer who invests money in selling the architect and contractor can't go wrong because he can't do business without these men. But he can easily repeat the terrible mistake made recently by one ill-advised advertiser who spent a fortune to acquaint the "man in the street" with his product when statistics proved that only one man in every 10,000 "in the street" would ever have the slightest chance to purchase this product.

A study of conflagrations reveals to some extent the fire-resistive qualities of building materials, but sometimes results are misleading because of uncertain conditions incident to fire out of control. Formerly after each big fire, manufacturers produced new forms of roofing,

partitions, and other structural materials which they believed fireproof until another conflagration showed the fallacy of the claim. It is no longer necessary to depend upon the uncertainty of conflagration conditions for tests. Severe fire conditions under control can now be produced, thus permitting expert observation of tests to determine the quality of various building materials before they are actually employed. The Underwriters' Laboratories has developed this work to a very high degree and today makes tests of materials including a great variety of products of hundreds of manufacturers. Upon approval of the product a label indicating compliance with the standard is supplied. Materials or articles tested in this way include roof coverings, wired glass windows, fire doors and shutters, electrical appliances of all kinds, automatic sprinklers and numerous other manufactured goods for the control of fire hazards.

Another agency that makes tests of various materials used in the building industry is the United States Bureau of Standards.

The work of influencing manufacturers to have their products tested and listed before they are used is of great importance. Nevertheless, although they may be tested and labelled, very little benefit will result if they are not properly installed. It is the business of general contractors, sub-contractors and construction laborers to see that the products are so used that full benefit will accrue. In this respect the manufacturers themselves may exert a strong influence. It is not sufficient for them to secure a customer; they must see that the product is properly installed. If manufacturers would insist that their product be used only in connection with standard construction in order to make buildings actually fire-resistive and well-protected, they would advertise not alone the possibility of fire-safe construction, but would inaugurate a program for the conservation of manufactured resources which would be of considerable national importance.

An example of this comes to mind: Manufacturers of sprinkler heads insist that all equipment be erected under their direction, to avoid, as far as possible, failure of the device to function because of improper installation. Many other manufacturers are jealous of the reputation of their products and where it is not practicable personally to supervise their installation they issue detailed instructions on the subject.

It is thus evident that the fire-safety of the future is in the hands of architects and the building industry, assisted by the manufacturers of fire-resistive equipment and materials. There is little doubt that there always will be fires that can be attributed to carelessness or lack of foresight, but when all buildings are constructed so that flames cannot spread far from the place of origin before the fire department arrives, the problem of fire-safety will to a large extent be solved. Speed that day!—*Safeguarding America Against Fire.*

MACHINE USES BLOWERS TO DRY NEW BUILDINGS

Heated Air Driven at High Pressure
Better than Natural Method

Artificial drying, which has been used successfully for years in many lines of industry to speed up output and improve product, is to be applied on a big scale for the thorough and rapid drying of new buildings.

Fundamentally, the principle involves the use of powerful fan blowers which drive heated air at high pressure through pipes to all rooms and because of the pressure, reaches all parts and quickly dries the structure. Building engineers who are conducting tests of this method declare that it produces a greater hardness of plaster after four days than naturally dried plaster has after two years. The machine also is adaptable to supplying temporary heat during building construction.

Tests are being conducted at Langdell Hall, Harvard University, where a large addition has been started. The new technique for drying buildings was developed in Germany and a prominent firm of industrial engineers in Boston is directing the test in an effort to verify, in this country, claims made by the Deuba Building Drying Corporation of Hanover, Germany. With this end in view one of the Deuba machines has been imported and set up. A corporation has been organized with a view to taking over the American patent rights if the tests prove satisfactory.

The machine is mounted on wheels, but of a type that will not be retained if the company decides to operate. The

iron pipes, which shoot the heat into the building are in sections and for transportation are fastened on top of the housing. Unlike salamanders, the Deuba does its work outside the building, using the pipes to convey the heat under pressure, by means of the blowers, from the air heater. The machine burns coke and a motor operates the fans.

Charles T. Holloway, 2nd, president of a large building supply firm in Boston, who has been operating the machine at Langdell Hall, has demonstrated it before leading architects and contractors in Greater Boston. They were interested in viewing it in action and later will be anxious to learn of the results of the test, Mr. Holloway says:

"Analyses of the gases in three rooms; one the entrance room, two, the middle room and, three, the room from which the air escapes, show a constantly decreasing amount of carbon dioxide from the air, changes it to calcium carbonate and frees water which, as a result of the hot air, changes into water vapor and escapes through the masonry. The excess water in the plaster evaporates according to the temperature of the air.

"The machine which produces these results gives a greater hardness of plaster after 4 days than naturally dried plaster has after 2 years, and consists solely of a fire grate which burns between 60 and 80 pounds of coke an hour through which air is driven by fan blowers operated by an electric, gasoline or Diesel motor. The temperature of the air blast can be maintained between 30 and 100 degrees centigrade by regulating devices on the machine. It is possible to dry out any building in from three to four days with a battery of these machines."

Building contractors, representing an annual aggregate buying power of approximately \$3,000,000,000, meeting quietly at Cleveland last week, took steps toward the elimination of unethical buying practices in the building industry, it was announced today by the Associated General Contractors of America.

Characterizing many of the current policies of both sellers and buyers of building materials and services as ruinous to the industry as well as detrimental to the public, the conference called by the Allied Construction Industries Committee laid plans for the nation wide establishment of standard credit policies aimed to relieve the industry of the tremendous burden of bad accounts which it was claimed were as injurious to legitimate contractor buyers as to sellers.

Compilations of itemized bad accounts in Detroit alone reveal \$4,000,000 in unpaid balances owed by contractors announced George B. Walbridge, general contractor of that city, who is chairman

of the national allied committee and who heads the credit rehabilitation bureau there.

This figure, claimed Mr. Walbridge, by no means represents the total of overdue accounts in the Detroit industry it being estimated that an overdue total of \$20,000,000 can be found there.

Similar estimates were presented from other cities where the plan for stabilizing credit in the construction industry has made progress. It was reported by Daniel W. Cauley, Manager of the Cleveland Branch of the National Association of Credit Men that he had data proving the annual loss in bad accounts amounted to \$1,000,000 in his city annually because of loose credit practices which can be remedied through the plan being applied elsewhere.

The credit stabilization plan, said to represent the first move ever made by buyers to insist that sellers stiffen up their credit terms, was reported as under development in twenty cities. Plans were laid to immediately extend the plan to an additional score of communities and to accelerate the work already started.

The contractors gathered at Cleveland, representing thirteen national associations of general and subcontractors, likewise formulated standard rules of fair practice aimed to eliminate unfair backcharges against subcontractors, the peddling and cutting of bids by buyers and sellers, forced acceptance of designated insurance carriers and other matters involving ethical business relationships.

Plans were laid to hold a trade practice conference with the Federal Trade Commission in order that formulation and enforcement of these and additional rules of fair practice may be made effectively.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A ten spot insures it fifty-two times in the course of a year.

America stands supreme in the development and use of advertising, and advertising is the seed which by implanting desire produces the fruit of social advancement. Education promotes efficiency and efficiency in turn makes possible higher earning power, higher purchasing power and improved living conditions.

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

PHILADELPHIA

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

**Never a
Drop of
Water
in this
Basement**

It's Waterproofed with "ANTI-HYDRO"

The concrete basement in this building had to be absolutely dry because it contained a restaurant, also the equipment and storage rooms for the theater.

In order to eliminate the slightest possibility of dampness the entire basement was waterproofed with a plaster coat mixed with "ANTI-HYDRO." It is permanently dry and free from the slightest suggestion of moisture.

You will find "ANTI-HYDRO" extremely easy to use. Being a liquid integral compound it mixes easily with water without the aid of skilled labor. It waterproofs, hardens and dustproofs concrete in one operation—accelerates the set of concrete, increases its strength and actually saves you money.

For 25 years "ANTI-HYDRO" has proved its merits on every type of concrete work. Results are **guaranteed permanent**. Use it on your next job.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

METALWELD, Inc.
26th and Hunting Park Avenue, Philadelphia

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Granite, brick, steel, bronze doors, bulks and entrance, tile and marble work, ornamental glass interior, terra cotta.

NATIONAL TRIBUNAL OPENS

Business Men May Arbitrate Their Disputes

New York City—America's greatest public arbitration Tribunal which will coordinate the nation's facilities for peaceful settlement of business disputes, will soon be officially opened. National in scope, its headquarters will occupy the entire 29th floor in the Tower of the new Lefcourt National Building, a 40 story skyscraper on the site of Fifth Avenue's oldest land-mark, at the corner of Forty-third Street.

The American Arbitration Association,

a non-profit making membership organization, will conduct this Tribunal which will correlate the facilities now established in the 1,650 important commercial centers in the country.

These headquarters have been made necessary by the business demand for arbitration which have far-out-grown the present facilities of the Association. This system is open at all times to the public regardless of trade or business affiliations.

Trade Groups Cooperate

More than 200 of the nation's most prominent trade and professional associations have unreservedly endorsed commercial arbitration as a necessary, practical business tenet and have been continuously active in securing the enactment of effective arbitration laws to protect the interests of the business and professional men and the farmer.

Hundreds of smaller trade and professional associations have recommended the insertion of arbitration clauses in the contract of their members' forms to insure the equitable, speedy, economic and amicable settlement of any dispute that may arise. The Public Tribunal co-operates with these trade tribunals, nearly all of which are affiliated with the American Arbitration Association.

In less than a decade, arbitration has grown so that business men, no matter where located, might settle their differences speedily and amicably at a minimum of inconvenience and expense. The dispute is submitted in a simple, non-technical procedure to the arbitrators mutually agreed upon by the disputants. Cases submitted to arbitration have a purely commercial aspect and in no event relate to labor relations or to criminal cases.

Lawyers Lend Aid

It has been the experience of business that settlements by commercial arbitration retain the business friendship between the disputants and are equally as just and more economical than recourse to litigation. Flooded dockets of civil courts, caused by expansion of the country's commercial system, has made commercial arbitration an immediate economic necessity, according to leading business and legal authorities. Where in many instances years are spent in arriving at a verdict in a law suit, a matter of days or even hours suffices in arbitration.

Has Distinguished Leaders

All of the 6,000 arbitrators serving in the 1,650 Tribunals serve without compensation and upon a few days' notice make themselves available for hearings as a contribution to the stability of commercial goodwill throughout the country. It is the fact that business men engulfed in disagreement have been able

to select their own judge that has led to such a widespread acceptance of the practice of arbitration. In many instances, the arbitrator selected is a man in the same profession or line of business as the disputants, the principals preferring a man with a thorough knowledge of trade practices and values involved.

The roster of executives and directors of the American Arbitration Association embraces names of a number of the most prominent jurists and business and professional men in America; names which stand high for practical expression of high ideals. President Hoover is an Honorary President and so practically interested that he wrote the Foreword for the Association's Year Book. Other Honorary Presidents are: Charles Evans Hughes, Newton D. Baker, Judge Moses H. Grossman and Charles L. Bernheimer.

Its regional vice-presidents, each with general supervisory powers in the administration of the Association's affairs are: Julius Rosenwald, of Illinois; Evans Woollen, of Indiana; Monte M. Leman, of Louisiana; Charles Nagel, of Missouri; John H. Puelicher, of Wisconsin; Robert Goodwyn Rhett, of South Carolina; Franklin Simon, of New York; E. G. Van Hoesen, of Idaho; and Harry A. Wheeler, of Illinois.

Officers are: Lucius R. Eastman, President; Frances Kellór, first Vice-President; Felix M. Warburg, Chairman of the Board; Charles T. Gwynne, Vice-Chairman of the Board; James H. Post, Secretary; Samuel McRoberts, Treasurer; Lee J. Eastman, Chairman Trades Board and L. K. Comstock, Chairman of Finance.

Lee H. Miller, Chief Engineer, of the American Institute of Steel Construction, has just started investigation of a new type of floor construction which is known as the "battleship deck" floor. This is a steel plate floor, which it is estimated, will give greater strength and stability to buildings, reduce the loads on the columns and therefore be especially valuable in skyscraper construction. Mr. Miller has given the following outline of this floor system:

The only reason for constructing a building is to provide a floor which can be protected from the weather by walls, windows and roof covering. The only reason for wanting a floor is to provide supports for a live load.

When the skyscraper came into existence it provided multiple tiers of floors, one above the other supported on a steel skeleton frame consisting of steel columns, girders and beams. At that time the steel industry furnished only the skeleton frame, which provided supports for the numerous floor panels. The industry stopped at this point and permitted the

general contractor, the architect and the engineer to devise some means of filling in the floor panels which were originally made of brick arches, later of flat tile arches, and still later of other types of material such as wood, packed floors, reinforced concrete and Gypsum.

At the inception of the multiple story tier building, the art of welding was unknown as it now exists, but the progress which has been made in this field has made possible the development of a type of steel floor which should meet every requirement that a floor construction is called upon to perform.

There is probably no part of a building structure which, under present conditions, has been more unsatisfactorily developed than the floor panel construction, and yet it is the one reason for having a building. Present methods of construction involve the use of material, in the floor panels, which constitute a dead load that is generally considerably more in weight than the live load which is to be supported. This excessive dead weight of the floor panels must be carried into the skeleton frame, girders and columns, and ultimately to the foundations. It is evident that one of the conditions which limits the heights of multiple story buildings will therefore be the capacity of the foundations to carry the dead load of the structure, which is greater than the calculated live loads. A reference to the column schedule of a multiple story building will reveal that the column stresses for dead loads are often approximately two-thirds of the total stress, the other third being live load.

By the use of steel plates and ordinary structural steel beams, it is proposed to develop a welded steel floor which will be better than any floor that has been used before, and will stand every service that it may be subjected to. It will be a floor in which it is possible to determine in advance, the stresses in all parts, and a floor that will recover instantly a full hundred per cent. of its deflection, due to live load when that load is removed. The one objection to such a floor system is that it has not been used before.

It is proposed to have 3, 4, 5 inch or other rolled I beams of whatever depth is found necessary, spaced 24 inches apart and spanning from girder to girder of the structural steel frame. Along the tops of these beams, will be laid continuous steel plate 3-16 or 1-4 inch in thickness, and wide enough to leave a space between their edges approximately 1-4 inch wide. The edges of the plates will be immediately over the center line of the webs of the small beams, and an automatic welding machine then works along this joint between the plates and welds the edges together, and at the same time welds them to the top flange of the beam immediately over the web. The result is

a built-up T section with the plate acting as the upper flange and the beam acting as the vertical part of the T. The neutral axis of the combined T section will be close to the top flange of the beam, and when the lower flange of the beam is stressed 18,000 per square inch, the plates and the top flange will have a stress of only 3000 to 4000 per square inch.

By using a 3 inch-5 7-10 I beam, and a 3-16 inch plate, such a floor construction will carry a total load of 190 per square foot on a 10 feet span with a deflection of .07 inch. The same floor will carry a total load of 85 per square foot on a 15 feet span with a deflection of .157 inch. The weight of the steel work including beam and plates for this floor, will be 10 1-2 per square foot.

By using a 5 inch 10 I beam spaced 2 feet centers, and a 1-4 inch plate, the combination will sustain a total load of 240 per square foot on a 15 feet span with a .098 inch deflection, and on a 20 feet span will support a total load of 135 per square foot with .174 inch deflection. The weight of the steel work in this floor will be 15 2-10 per foot.

It is, of course, assumed that this combination construction will be made continuous over the tops of the supporting girders, or by framing them into the girders flush on the top and have the floor plates continuous. The loads above given are based on fixed end supports, and the deflections are determined by the same basis.

The next question which arises is what will be the strength and deflection of the plates between the supporting I beams to which they are welded, which are 24 inches apart. A 1-4 inch plate will carry a uniformly distributed load of 562 per square foot, and have a deflection of .115 inch between the small beams. This plate will carry a load concentrated between the small beams of 750 per linear foot, and have a deflection of .057 inch. Under the same conditions the 3-16 inch plate will carry a uniform load of 316 per square foot, or a concentrated center load of 422 per linear foot. These loads are, of course, far in excess of what the T section will develop, and indicates that the floor construction is amply safe in both directions.

The cost of welding the bead between the edges of the plate and to the top of the beams has been estimated by different contractors, and one of them has stated that with automatic machinery it should be possible to deposit the bead weld for less than 2c per linear foot. Another contractor has stated that he is ready to enter a contract for this welding at between 3c and 4c per square foot of floor. Inasmuch as the welding will be done along a line, but a short distance from the neutral axis, the difficulty of the

floor curling up due to shrinkage will be practically negligible.

With this type of floor construction there is generated a solid steel deck which will act as a girder to prevent any torsional distortion of the building when subjected to wind or earthquake action. It will enable the engineer to select that part of his structure which is to carry the wind stresses to the foundations, and be assured that the deck flooring will deliver the stresses to the most rigid part of the vertical frame. The floor construction can be carried out into the walls to provide spandrel construction to support the outside walls. It will, of course, be necessary to fireproof such a floor when the combustible contents of the structure will generate a heat that will produce a temperature in the steel in excess of 1000 degrees F. This fire protection can be taken care of either by cast blocks of fireproofing inserted on the lower flange of the small beams, or by metal lath and plaster ceiling. Either type of construction will provide openings for conduits which can be carried along the main girders and transversely under the steel plates between the small beams. On the other hand if it is found advisable to do so, it will be possible to have a light fireproofing applied to the top of the steel plates and incorporating the various conduits which lay on top of the plates.

At the present time the specifications that are written to regulate the testing of floor construction, contemplate a fire on the upper surface. It has, however, been assumed that the filling which is put on top of the ordinary floor panels to cover conduits, acts as a fireproofing for the top flange of beams and girders. On the other hand, if our grate bars and furnace construction is a precedent, it should be possible to have a very considerable fire on the top of the steel plates without the temperature becoming dangerous. This is due to the fact that all heat generated from combustion will rise, and all air necessary to feed combustion must come from near the floor.

It will be possible to provide any form of treatment to the top surface of these plates, either mastic finish, linoleum, cork tile or other forms of coverings. The Armstrong Cork Company have stated that they recently took a contract for furnishing approximately 40,000 square feet of cork tile floor for the Cleveland Terminal Tower Building at a price of 42c per square foot. This cork tile is 3, 4, 6 or 12 in. square, and can be cemented to the top of the steel plates, providing any required Mosaic pattern, and giving a floor that will eliminate the necessity of rugs, except as ornaments.

The total cost of a floor constructed of 3 inch I beams, 3-16 inch plates, covered on the top with cork tile and fireproofed on the under side with metal lath and

plaster, will be in the neighborhood of \$1.00 per square foot. It should be remembered in this connection, however, that the cork tile flooring eliminates the necessity of any other floor coverings, which is always a part of a tenant's expense when using an ordinary concrete floor. The cost of a good quality Chenille carpet is from \$1.25 to \$1.50 per square foot, and the above referred floor system will cost complete less than the carpet, and eliminates its necessity.

It has already been stated that the objection to this floor is that there is no precedent for it, but this is not exactly true since the decks of battleships and the charging floors of our open hearth furnaces are all made with 3-16 inch to 1-4 inch plates, and are subjected to the most severe service that any floor can receive.

For bridge floor construction a combination of steel beams with checker plates could be assembled that would very materially reduce the dead load of the structure and provide a lateral rigidity more satisfactory than any lateral floor diagonal now used. It will be found that checker plate floors are used at the present time to take care of the wear on wood floor bridges, and the question of their being slippery has never been raised. In fact checker plate floors are used constantly for stair treads and landings.

This type of floor construction will weigh from 20 to 60 less than any of the existing types now in use, and in connection with a proposed 75-story building with floor panels 21 1-2 x 22 1-2 the saving in dead load on the foundations for each column will be nearly 2,000,000 lbs.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

Bascule, bent-eye, bulldozer, cantilever, club dolly, extrados, gantry, gib, goose-neck, gusset, hicky, jig, jumper, locus, lute, outhaul, pickling, pinny, puddle, purlin, rabbling, scribe snips, spandrel, strut, toggle, are among the more than 22,000 words used by structural steel engineers, which are defined in the "fact book" of the industry which is now being published by the American Institute of Steel Construction, Inc. The new volume includes a directory of fabricating shops in the United States, Canada, Mexico and Hawaii, in addition to presenting a statistical outline of the progress of steel

construction in the country. It will contain a list of the most recent and authoritative technical publications on structural steel and a bibliography of moving pictures illustrating the same subject.

Building of single family houses has been the outstanding development in the field of residential construction during the past decade in the United States, according to Dr. John M. Gries, author of one of the chapters of the survey of the National Bureau of Economic Research. The survey will be published shortly with the report of the Committee on Recent Economic Changes of the President's Unemployment Conference. Dr. Gries notes that the construction of two-family houses is steadily decreasing in importance.

"Construction of single houses," writes Dr. Gries, "made a quicker start in 1919 than the construction of apartments and held up better in 1920 and 1921. Families which had to find accommodations used their capital and credit to acquire homes, taking a risk of a possible fall in prices where investors hesitated to erect apartments."

"The post-war construction of one family houses reached its peak nationally in 1925, a year prior to the peak in multi-family structures. One family dwellings when not erected by the occupant, are almost always erected for sale rather than for rent. Overbuilding of this type in advance of immediate demand has resulted in various cities in violent curtailment of programs, such as a 50 per cent. reduction from one year to the next, but growth in demand has usually resulted in a fairly rapid recovery of more normal conditions."

"Careful surveys of annual vacancy were found by field investigation to stabilize this type of building fairly well in Utica, N. Y., and similar surveys are being undertaken in a growing number of cities."

"Overbuilding of apartments, which are built to rent does not have such an immediate effect upon new construction; even where new apartments are not needed they may be partly occupied, and they may be sold to investors who are not well informed as to local conditions."

"The desire of families to live in more satisfactory homes and surroundings has been the force behind the large home-building program. As has been customary, the new houses erected in and around cities have been for families in the upper income groups, with comparatively little construction for families in the lower groups which, for the most part, occupy older, less desirable structures."

"The private automobile and the bus, with improved roads, have greatly en-

larged the area within which dwellings may be located, and have permitted comparatively open developments in attractive locations to an extent that would not have been possible before the war. The demand for outdoor recreation favors the home situated away from the center of the city. The families' enlarged radius of movement due to the automobile, together with the neighborhood movie, the radio, and shorter working hours, strengthens the call toward the suburbs.

"In many cities the percentage of vacancies in run-down and undesirable dwellings, particularly in congested districts, has been mounting during recent years. It is reported that the diminished number of new immigrants has much to do with this situation. In a number of cities the construction of shacks or other forms of temporary dwellings, such as occurred soon after the war, has practically ceased.

"Although the lowest priced new houses being erected in many cities are out of reach of most families having less average incomes, they represent improved minimum standards as to light, air, and sanitary facilities. This is likely in the future to be reflected in better housing conditions, for the worst accommodations in use today are usually structures which, when erected, were far short of meeting the present minimum standards for new dwellings.

"Owing to the desire of well-to-do families to move into more modern quarters, families less well-to-do may in effect receive a subsidy through the ability to obtain second-hand houses at a discount greater than actual depreciation. A problem may arise as to the use of land now occupied by the poorer types of housing which are being vacated."

Dr. Gries was formerly chief of the division of building and housing of the Department of Commerce. The data which forms the basis of his chapter entitled "Construction" were gathered under his supervision and covers the years 1919-1927.

The survey was begun by the National Bureau of Economic Research in January, 1928. The Committee on Recent Economic Changes completed its examination of the survey data on March 2, 1929. The report and survey will be published in May under the title "Recent Economic Changes" by the McGraw-Hill Book Company.

The Committee on Recent Economic Changes is a continuation of the President's Unemployment Conference of 1921-23 which under a sub-committee on Business Cycles and Unemployment then made a report on booms and depressions. The Committee as now constituted consists of President Hoover, its chairman,

and the following: Walter F. Brown, Renick W. Dunlap, William Green, Julius Klein, John S. Lawrence, Max Mason, Adolph C. Miller, Lewis E. Pierson, John J. Raskob, A. W. Shaw, Louis J. Tabor, Daniel Willard, Geo. McFadden, Clarence M. Woolley, Owen D. Young, and Edward Eyre Hunt, Secretary.

VENTILATION HALTS MANY PLANT DISEASES

Greenhouses Create June Weather Artificially; Home Plants Need Air

Comfortable air conditions and good ventilation must be provided in greenhouses for the proper growing of food plants and flowers with as much thought and care as air conditioning in modern theatres, office buildings and public schools, according to leading horticultural experts who recently surveyed this trend among greenhouse operators throughout the United States.

Plants breathe just like human beings and often are even more sensitive to changes in temperature and humidity than any animal, the horticulturists declare. And whether the plants are tomatoes, cucumbers, strawberries or carnations, they require a certain amount of air motion to help them to grow healthy and strong. Tomatoes, cucumbers and other foods frequently spoil on the vine because of excess moisture in the air.

The result is that many of the more progressive greenhouse operators have installed air control systems to manufacture perfect June weather the year round. Powerful exhaust fans carry out moisture and bad air, while other distribute fresh air after it has been driven through heating and humidifying coils. Some greenhouses are even using ultra violet rays in connection with air conditioning for the enriching of the food values of vegetables on days when needed sunshine is absent. In addition to these facilities, the greenhouses provide, of course, artificial rain by means of sprinkler systems.

Louis Miller, widely known horticulturist of Toledo, pointed out that air motion is vital to the proper sustenance of the so-called "vine" plants, which spoil because of excess moisture without air motion.

"Air circulation is not quite so important to the leaf plants such as leaf lettuce which grows practically anywhere," Mr. Miller said.

Mr. Miller added that one of the most unusual applications of air conditioning in greenhouses is that tropical plants can be grown when the weather is zero outside. In this way, too, the greenhouses have conquered plant diseases.

A. G. Newhall and Dr. R. F. Poole of the Ohio agricultural experiment station

have found, for example, that the leaf mold disease which attacks tomato plants in greenhouses can be controlled by mechanical ventilation. The fungus which causes the mold, they said, requires a high degree of humidity to develop sufficiently to destroy the crop. They have been able to overcome the disease by removing excess moisture, the extent of which may be judged from the fact that a field of tomatoes under June conditions may give off 400 gallons an hour. Similar difficulties have been encountered with other crops grown in greenhouses during the winter months and the ventilation method is expected to have an even wider application, Dr. Poole said.

A method of simulating spring artificially in a modern version of the old family ice box is used at the Virginia department of agriculture and immigration, Richmond, for testing the germination of farm seeds. By a specially prepared chamber and an artificial refrigerator, controlled temperatures are obtained over test seeds in special boxes. Even the breezes of spring, so far as they are useful to the fields of farmers, are preserved through the action of cold water running through the apparatus and providing the air purification that takes place in open fields. Spring's sunshine is reproduced in its essential effects through an electric heater whose emanations are distributed from beneath a covering of water.

Ventilation in the dwelling is somewhat different than that in the greenhouse, and the plants are apt to suffer due to improper circulation of air. A little fresh air on warm days, with care taken to prevent sudden changes of temperature, and to avoid draughts, will go a long way toward success.

A light soil, as a rule, is generally to be preferred for most house plants, but the type of plant determines the character of soil to be used.

In potting, the main things to be considered are (1) press the soil firmly against the roots; (2) avoid injury of roots when the plant is transplanted; (3) provide for drainage and (4) allow room at the top of pot for water.

In general, flowers are grown in the garden for two purposes; namely, enjoyment of the flowers on the plants in the garden, and to provide for a succession of cut flowers to be used in the house. When grown for cut flowers, little thought is necessary as to their arrangement in the garden, the main idea being to give them plenty of room, so that they may develop good individual plants, thus insuring long stems. If they are grown for effect in the garden, some sort of plan should be made, keeping in mind colors, succession of bloom, flowering period, and average height of the plant.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

The Concrete Floors in this Garage are Ten Years Old—But Good As New!

The extreme wear to which these garage floors are subjected has had no effect on them. That's because they are **permanently** hardened and waterproofed with "ANTI-HYDRO." Furthermore, they were put in use the next day.

Water, oil, grease and wear from tire chains do not harm "ANTI-HYDRO" hardened concrete. Being a liquid integral compound, "ANTI-HYDRO" builds hardness throughout, producing permanent results instead of temporarily hardening the surface.

All concrete garage floors should be hardened and waterproofed—especially in buildings of two or more stories. By using "ANTI-HYDRO" you are sure of concrete that will withstand the most severe conditions.

"ANTI-HYDRO" is easy to use. Simply add it to the mixing water. Requires no skilled labor. Saves time and money.

For 25 years "ANTI-HYDRO" has been used on every type of concrete hardening and waterproofing work. Satisfactory results guaranteed. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

LUMBER AND WOOD PRODUCTS NEED BETTER CARE ON CONSTRUCTION JOB

Forest Products Laboratory Expert Explains Some Causes of Plaster Cracks and Rattling Doors and Windows

"Lumber on the building job must be given as good care and protection as other material if the owner is to avoid future repair bills, discomfort, and annoyance," Mr. Rolf Thelen stated at the recent forest research conference at the Forest Products Laboratory. "Look at most any construction job and compare the difference in the way lumber and other materials are handled. If you happen on the job during a rain, you will find the contractor has placed tarpaulins over the bricks in the pile. You will find that the mortared joints where the men have stopped laying bricks for the day are properly covered up. You will find that much of the cut stone has been protected with tar paper, and the cement is stored in a tight shed. All very good; but how about the lumber? You will find that the frames of the windows are standing out in the open without any protection except one thin coat of primer on some of the surfaces. The mill that made them evidently thought ahead far enough to put a suggestion of protection on some parts of them, but once delivered on the job the care of these frames has been turned over to Providence. We admire this confidence in wood, but we know that the contractor would save money for himself and both trouble and money for the owners of the building if he would take even as

good care of the lumber as he takes of the brick.

"The neglected frames will swell as the rain soaks into the wood. At best the swelling will cost the contractor money because his men will have more work to do in getting the frames into place, and later in making the windows fit the frames. The swelling will cost the owners money because the wood will shrink

as it dries out again, and then the windows will leak cold air in the winter and may even leak rain or snow. It will cost more to heat the structure.

"Further, there are other possibilities that may be worse. If the frames are partly in shadow when the sun comes out again, they will dry unevenly and may warp. If they warp, all the troubles will be intensified. And there is no need of it. In the main, lumber manufacturers are today seasoning lumber satisfactorily. When the wholesalers and retailers handle it properly, it reaches the job in good condition. Then the contractor, at least the average contractor, undoes all the good work by leaving the lumber out in the rain. The lumber manufacturer spends money to dry his product as it should be dried and the owner of the building pays him for doing it. But the contractor, with few exceptions, wastes all this effort and all this expenditure. And the owner pays for his waste."

Doors act in the same way as the windows. So do walls and partitions, and in consequence the plaster cracks. "The trouble is preventable, and it will be prevented," Mr. Thelen ventured, "as soon as the owners wake up and take a hand in the matter. That all contractors can protect lumber properly is proved by the few that are now doing it. And although wholesalers and retailers are not blameless, the average contractor can ill afford to criticize them, because as a rule it is delivered to him in much better condition than when the contractor puts it in place."

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

PROTECTION AND SAFETY WORK

Committee on Accident Prevention of the Building Trades Employers' Association Completes Helpful Safety Specifications

A specification entitled "Protection and Safety Work" has recently been issued in new form by the Committee on Accident Prevention of the Building Trades Employers' Association of New York, as another step in its campaign to reduce casualties on construction work in New York. This specification which is now in the same form as the contract documents of the American Institute of Architects to make it convenient for use by both architects and builders, contains provisions which the committee considers important for safeguarding the work to prevent injury to the workmen. The articles of the specification include much valuable information and are as follows:

The owner and/or contractor shall install and maintain all of the safeguards enumerated in Articles 1 to 15 inclusive, of this specification and shall comply with the requirements of all laws and ordinances in force in the locality where the work is situated relative to the safeguarding of the work to prevent injury to persons. All safeguards shall be constructed in accordance with the requirements of such laws and ordinances. Sizes and other details specified shall be considered as the minimum requirements and shall be modified and extended to comply with any existing law or ordinance. When a situation arises where two or more of these safety rules may apply and there is doubt as to which one should be used, the rule which is the more practicable and

which affords adequate protection may be followed. The following rules describe safety measures to be employed for the prevention of accidents:

ART. 1. *First Aid*.—Provide and maintain an ample supply of iodine or mercuriochrome and aseptic gauze bandage in a suitable cabinet.

ART. 2. *Ladders and Temporary Stairs*.—Install and maintain ladders or temporary stairs of ample strength to give access from one floor to another after the structural flooring is in place and until the permanent stairs are available. Such ladders or temporary stairs shall be of such size and so located as to give proper facilities to all workmen engaged on the work. The side rails of each ladder shall extend at least thirty-four (34) inches above the platform or floor it serves and when required, ladders should be made at least four (4) feet wide with three stringers. Temporary stairways, if installed, shall be provided with substantial handrails.

All intermediate landings shall be substantially constructed without openings between the planks and all intermediate landing and ladder openings in the floor shall be enclosed by a railing and a toe board as described below under heading "Floor Openings" so that a person cannot step into the ladder shaft except at the openings provided for the ladders.

Also provide similar ladders before the structural floors are started and above the top floor on which the structural flooring has been placed. Each ladder shall be secured against slipping and shall extend at least thirty-four (34) inches above the floor or platform it serves. At top and bottom of each ladder provide solid wood platforms, at least two (2) feet longer than the width of the ladder and with an approximate width of three (3) feet.

ART. 3. *Permanent Stairways*.—Stairwells for permanent stairways shall be guarded on all open sides with railings and toeboards as described below under "Floor Openings" and all permanent stairways shall be provided on open sides with substantial temporary planed wood handrails, thirty-six (36) inches in height, measured from the center of the tread.

Stairways on which treads and landings have to be filled in later with cement or other filling material shall have temporary wooden treads and landings, or other equally suitable material, to the height of the nosing, full width of the tread and landing, firmly fitted in place and replaced when worn below the level of the metal nosing. Where skeleton iron stairs are installed, they shall have wooden treads and landings not less than two (2) inches thick. All treads and landings shall be free from protruding nails and splinters.

ART. 4. *Permanent or Temporary Elevator Car Used for Carrying Workmen*.

—Where a permanent or temporary elevator car has been installed and is used during construction for carrying passengers, the hoistway shall be completely enclosed in partitions not less than eight (8) feet high, and all openings therein fitted with doors locked on the hoistway side. The car shall be fully and substantially enclosed on all sides, including the top, except as required for entrances.

ART 5. *Floor Openings.*—All openings in floors (except such as are necessary to be opened for immediate use) shall be protected by guardrails approximately forty-two (42) inches high with uprights not less than two by four (2 x 4) inches, spaced not more than eight (8) feet apart. The top rail shall be not less than two by four (2 x 4) inches or equivalent section and the midrail not less than seven-eighths ($\frac{7}{8}$) inch by four (4) inches. Each guardrail shall be provided with a toeboard, not less than seven-eighths ($\frac{7}{8}$) inch by six (6) inches, placed on edge. As an alternate, small openings may be planked over in a substantial manner.

ART. 6. *Guarding Material Hoist Shafts.*—Two sides of all material hoist shaftways shall be enclosed at each floor to a height or not less than eight (8) feet, with wire netting of not less than No. 10 U. S. standard gauge and not more than one and one-half ($1\frac{1}{2}$) inch mesh, or expanded metal of equivalent strength, secured to uprights so spaced as to afford a strong and substantial guard. Wood slats laid preferably horizontal may be used instead of wire netting with openings between slats not to exceed one and one-half ($1\frac{1}{2}$) inches. The guard shall extend, if practicable, two (2) feet beyond sides of the shaftway. At two sides of the hoistway used for handling material, there shall be bars three (3) feet high bolted or otherwise secured at one end to the guard, and placed, where possible, not less than two (2) feet from the edge of the shaft opening. Such bars shall be not less than two (2) inches by three (3) inches, made of spruce or other approved material of equal strength. A toeboard at least seven-eighths ($\frac{7}{8}$) inch by six (6) inches shall be installed on

open sides when not being used for handling material.

ART. 7. *Concrete Bucket Shafts.*—When a concrete bucket tower is located within the building, it shall be enclosed on all the sides which are less than three feet from the edge of the shaftway or opening in which it is installed, or on the sides where scaffolds may be erected, by attaching boards, wire netting or expanded metal to the frame work of the hoist tower, or to other suitable supports, leaving suitable openings for the bucket to dump. If wire netting is used, it shall not be lighter than No. 10 U. S. standard gauge with not more than one and one-half ($1\frac{1}{2}$) inch mesh. If expanded metal is used, it shall be of equivalent strength and mesh. If wood slats are used, they may be laid vertically or horizontally, but the spaces between slats shall not exceed one and one-half ($1\frac{1}{2}$) inches.

When shaft is outside of the building, guardrails and toeboards shall be placed on sides of runways to hoist shaft, and side of shaft which faces the building shall be guarded as specified above, except space where bucket dumps.

ART 8. *Swinging Scaffolds.*—Every scaffold swung from an overhead support, which is ten (10) feet or more above the ground or floor, shall be of ample strength, not less than twenty-seven (27) inches in width and provided with a substantial railing and toeboard along the outer edge. All ropes, cables and blocks supporting scaffold shall be capable of sustaining at least four times the maximum weight of the material and men to be placed on the scaffold, and means shall be provided to prevent the scaffold from swaying.

ART 9. *Suspended Scaffolds.*—Platforms suspended by steel cables and operated by hoisting machines for the use of bricklayers and for similar use shall be supported by outriggers or other form of support equal in strength to seven-inch I beams having a weight of fifteen and three-tenth (15.3) pounds per foot. Outriggers shall be not more than nine (9) feet apart. The platform shall be made of sound plank not less than two (2)

inches thick properly secured and laid close.

The outside of the platform shall be provided with a substantial railing of iron or wood not less than forty-two (42) inches high, and provided with a toeboard not less than nine (9) inches high. The space between the toeboard and the railing shall be filled in with wire netting of not more than three-quarters ($\frac{3}{4}$) inch mesh. An overhead protective covering shall be maintained at such time as the platform is in use, at a height of not more than nine (9) feet above the working platform.

ART. 10. *Built Up Scaffolds.*—All scaffolds shall be of ample strength to support the maximum number of men to be placed on same plus the weight of the material. Scaffolds more than fourteen (14) feet in height shall be provided with substantial railings thirty-four (34) inches high and toeboards nine (9) inches high on all edges which are not close to the walls. When a scaffold crosses a window or other opening which extends five (5) feet or more above the platform of the scaffold, a similar guard and toeboard shall be placed across the opening.

ART. 11. *Outrigger Scaffolds.*—Outriggers where projecting not more than six (6) feet from the face of the wall or building shall be sound yellow pine or spruce not less than three by ten (3 x 10) inches or other approved material of equal strength, and shall be well braced and secured to prevent tipping or turning. The platform shall be of sound yellow pine, spruce or other approved material of equal strength, not less than two (2) inches thick, laid close. The outside of the platform shall be provided with a substantial railing of iron or wood, not less than forty-two (42) inches high, and provided with a toeboard not less than nine (9) inches high. The space between the railing and the toeboard shall be filled in with wire netting of not more than three-quarters ($\frac{3}{4}$) inch mesh.

ART 12. *Special Scaffolds.*—Construct and maintain suitable scaffolding of sufficient strength as may be required for exterior work on towers, spires, etc., and

interior work in churches, theatres, auditoriums and the like.

ART. 13. *Artificial Lighting.*—Install and maintain lighting for the under side of the protection over sidewalk; also for temporary illumination of the building. Suitable feeder lines should be installed extending from the bottom to the top of the building, and of ample capacity to properly provide for all spaces requiring light, and at the same time, service for all motors contemplated to be used. Install and maintain one light at each floor landing in fire tower and stairways and at such other places as may be necessary to properly light the stairway; also, in exits to streets, and on all elevator cars used for carrying passengers.

ART. 14. *Planking Derrick Floor.*—Where structural steel is being erected, the derrick floor shall be entirely planked over.

ART. 15. *Sidewalk and Overhead Protection.*—Maintain safe sidewalks for the use of pedestrians including overhead protection for same with its outside columns secured against lateral displacement as required by laws and ordinances in force in the locality. Where an overhead sidewalk bridge is used for the storage of material, it shall not be overloaded.

—*The Associated Contractor.*

"HE PROFITS MOST, WHO SERVES THE PUBLIC AND HIS VOCATION BEST"

A service rendered is another step forward along the rough road of success, for the road to success is generally rough and hard to climb, few are those who have not had to fight almost every step of the way. We are engaged in serving that great market, the public, those of us who serve the public well, at times sacrificing self and personal gain, soon establish a reputation for fair and impartial dealing, create confidence in those we meet, and they in turn advise their friends to patronize us. No business that is fundamentally and financially sound ever followed any other rule or policy than "He profits most, who serves the public and his vocation best."

This great rule applies strongly to those of us engaged in building construction, how well the words of the great bard fit our case, "Make a house where Gods might dwell, beautiful, entire and clean." Builders wrought with greatest care each minute and unseen part, for the Gods see everywhere. And it just those unseen parts, that hidden foundation, the strength of the girders, the right proportion of the concrete, the right grades of lumber and material, that make the completed job one to be proud of, or a menace to public safety. There should be that strong love of our craft, that pride in the development of the things we build, that we

would scorn to use methods that tend to weaken instead of strengthen the construction for which we are responsible.

It is not a fact that we can not make a fair and reasonable profit unless we resort to those methods used by the cut and run so called contractor, we are not idealists, we are practical business men engaged in the greatest of all crafts, building construction. We have spent the best years of our life acquiring the knowledge necessary to fulfill the plans of the designer, on our shoulders rests the burden of the accomplishment, surely we should feel the pride of this accomplishment.

Our knowledge of the craft should not be a means to cut corners, and resort to clever substitution. We are able to stand on the results of our accomplishments, our greatness is measured only by our ability to create. We must render the best we have, our reputation is valued by the results of our efforts, take this away from us and we have nothing left. There is no hope of repetition once we are found out as one who skimps the job at every possible opportunity, substitutes inferior material wherever possible, ignores his responsibility and duty to the one who pays him to perform the job honestly and well.

There are those who think they can "get away with it" and for a time they do, but there is always that time when the day of reckoning comes, when at last they face exposure, their sins have found them out, and at last they are confronted with facts and evidence of their deceit, facing a crisis that could have been avoided, had they pursued a sound and fixed rule. He profits most, who serves the public and his vocation best.—*East Bay Builder.*

Approximately 1,800 miles of improved roads will be constructed by the Department of Highways during the coming biennium, starting June 1, the most extensive construction and replacement program ever launched in the history of Pennsylvania, James Lyall Stuart, Secretary of Highways, announced May 28. Practically every section of the State will be benefitted by this immense program, made possible through bills passed by the 1929 Legislature and approved by Governor John S. Fisher.

The principal item in the program will be new construction of 1,100 miles of roads, which will include replacement of 300 miles of old and worn-out, macadam pavements. The entire 1,100 miles of new road, financed one hundred per cent by the State, will be improved on the highway system only. The major portion is financed by the \$23,500,000 appropriation in the Wheeler-Flynn Act approved by Governor John S. Fisher on May 1, 1929. This appropriation is allocated to the several counties on the ratio of the unim-

proved State highway mileage in the county to the unimproved mileage on the whole State highway system. No county receives less than \$200,000 nor more than \$600,000.

In addition to this 1100 miles of new roads, the Department of Highways has a carry-over construction of 500 miles of newly surfaced roads into the 1929-1930 biennium. This unfinished construction includes 331.70 miles of uncompleted contracts from 1928, and 168.30 miles advertised since January 1, 1929, and up to and including May 22, 23 and 24 lettings. Practically all of this class of construction will be under way within the next thirty days.

Under the State-aid System, counties will be benefitted by the 1929-31 aid appropriation of \$2,000,000, which when increased by counties proportion will build approximately 60 miles of improved road. This money is allocated to the various counties on the basis of township and county road mileage within the counties. The money is only available to the counties provided the counties agree to match the State appropriation. In counties of the first to sixth class the improvement is on a fifty-fifty basis; in counties of the seventh and eighth classes the State assumes 75 per cent of the cost, and the local authorities 25 per cent. The State-aid appropriation may be used on or off the State highway system, according to the preference of the county commissioners.

Another item is the expenditure of \$3,000,000 to \$3,500,000 on 80 miles of new construction, to be financed one hundred per cent by the counties. A number of counties will contribute toward State highway improvements to extend the projects beyond the limits which can be financed by the Wheeler-Flynn appropriation to reach a community or village, or in order to improve entirely the unimproved section of highway. Such extension may be financed solely by the county, or in conjunction with the townships.

Funds, amounting to \$2,000,000, have been set aside for the construction and replacement of 60 miles of city streets. Recent legislation, approved by Governor Fisher, provided that the Department of Highways take over city streets connecting State highway routes, and it is estimated that funds will permit the construction and replacement of sixty miles of such streets. This fund may also be used for maintenance of the streets at the discretion of the Department of Highways.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship, it is going to miss by just that much the pulling power it ought to have.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

The Concrete Floors in this Garage are Ten Years Old—But Good As New!

The extreme wear to which these garage floors are subjected has had no effect on them. That's because they are permanently hardened and waterproofed with "ANTI-HYDRO." Furthermore, they were put in use the next day.

Water, oil, grease and wear from tire chains do not harm "ANTI-HYDRO" hardened concrete. Being a liquid integral compound, "ANTI-HYDRO" builds hardness throughout, producing permanent results instead of temporarily hardening the surface.

All concrete garage floors should be hardened and waterproofed—especially in buildings of two or more stories. By using "ANTI-HYDRO" you are sure of concrete that will withstand the most severe conditions.

"ANTI-HYDRO" is easy to use. Simply add it to the mixing water. Requires no skilled labor. Saves time and money.

For 25 years "ANTI-HYDRO" has been used on every type of concrete hardening and waterproofing work. Satisfactory results guaranteed. Use it on your next job.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

METALWELD, Inc.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Brick, steel, 2 stories and basement, 226x78 feet, wing 75x45 feet, slag roof.

Miscellaneous Contracts Awarded

Residence, Wilmington, Del. Contract awarded William F. Hadley, Claymont, Del. Architect, W. E. Hance, Equitable Building, Wilmington, Del. Owner, P. C. Sisler, Equitable Building, Wilmington, Del. Stone, 2½ stories, 28x38 feet, shingle roof, hardwood floors, hot water heat, electric light, tile work.

Armory (add. and alts.), Laurel, Del. Contract awarded W. E. Booth & Son, Salisbury, Md. Architect, E. C. May, DuPont Building, Wilmington, Del. Owners, State Armory Commission, Wilmington, Del. Brick, steel, 1 story, 30x45 feet, composition roof, cinder and pine floors, electric light, kitchen equipment.

SKILL IN CONCRETE PROPORTIONING

Use of Water Ratio Methods Enable Responsible Contractors to Place Better Concrete at Lower Costs

Progress in the manufacture of concrete has been so rapid that the contractor who is informed and equipped to take advantage of recent developments is in an enviable position. Instead of working a hardship as was anticipated by some, the new methods are resulting in actual savings in cost of both material and labor.

These methods which have come about through the establishment of water-cement ratio proportioning of concrete, are steadily increasing in popularity and bid fair to become standard practice within a few years.

Strength Depends Upon Amount of Water Used

The principle of water-cement ratio proportioning is simple and easy to under-

stand. A sack of cement mixed with any definite quantity of water forms a paste. When this paste is mixed with fine and coarse aggregates in such proportions as to produce a plastic concrete mixture a definite quality will result.

The strength of the paste, and therefore the strength of the concrete, depends primarily upon the quantity of water used. The more water the less strength.

Since a sack of cement contains a fixed amount of solid volume, the volume of paste obtainable by mixing one sack with a definite quantity of water is also fixed. The secret of water-cement ratio proportioning lies in the most efficient use of this quantity of paste.

With the quality of the paste established the mix can be as wet or as dry as the conditions of placing require, so long as it can be placed without segregation or honeycombing, yet the strength of the concrete will be unchanged. Of course the wetter the mix the less economical it will be, since the drier mix permits the use of a larger volume of aggregate per sack of cement. But the old bugaboo of the necessity for excessively dry mixtures is eliminated.

Produces Larger Yield at Lower Placing Cost

The water-cement ratio method thus places a direct premium on a thorough knowledge of proportioning through the resultant saving in cement (greater yield of concrete per sack) and through improved workability (greater ease and therefore lower cost of placing).

The irresponsible or "Jerry" contractor will soon find himself out of the running through his inability to take advantage of this method. Only the responsible contractor, who, by his knowledge of water-cement ratio proportioning and his ability to control job conditions can guarantee a uniform concrete of definite quality will be able to share in the savings effected by water-cement ratio control.

In the past it has been customary to specify definite proportions of cement to fine and coarse aggregate when it was desired to produce concrete of a certain minimum strength. Usually no consideration was given to the characteristics of the available aggregates nor to the difficulties which might be encountered in placing.

Naturally, it was necessary to aim at a strength appreciably higher than that required in order that variations in job conditions should not result in a part of the structure being of inferior quality. This represents a margin of safety in part of the work which, with our present knowledge of proportioning, is nothing less than extravagant.

In spite of this margin, the absence of definite means of control has often re-

sulted in work which was not up to the standard assumed in designing the structure.

An unwarranted hardship has been imposed upon some contractors in the past through misunderstanding and improper application of the water-cement ratio principle by a few engineers and architects.

Engineers with Scant Knowledge Boost Costs

Through a scant knowledge of this principle and lack of knowledge of proportioning, these men have specified fixed proportions and then have insisted on reduction of the water-cement ratio through the use of excessively dry mixtures. This usually resulted in increased labor costs and often produced honeycombed, porous concrete.

With the water-cement ratio fixed, the matter of proportioning is left largely to the contractor. The advantage of being able to adjust the per cent. of sand in the mix will be apparent to those who have experienced difficulty in placing the undersanded mixtures commonly specified. A further saving to the contractor results from the elimination of practically all patching.

Properly designed concrete mixtures can be easily placed with a minimum of segregation and "stone-pockets." Once the desirable proportions for workability have been determined by trial, the procedure differs but little from that previously followed except that all materials including water are more accurately measured.

Where fixed proportions have been specified it has been common practice in the past to place certain restrictions on aggregate types and gradings. These restrictions often excluded local materials and necessitated purchasing more expensive aggregates from outside sources.

The freedom in proportioning afforded by the new method often makes possible the use of good local materials, formerly rejected because of deficiencies in grading. It may be that local aggregate will produce a slightly smaller yield of concrete of the same strength, but this is usually more than offset by the saving in haulage costs.

The owner, too, profits by the use of the new methods. He is thus assured that the concrete will be of acceptable and uniform quality. External appearance will be much improved by the absence of honeycomb and patching.

Where water-tightness is essential it can be definitely obtained by controlling the water-cement ratio and the workability of the mixture. In brief, the guesswork which characterized the indiscriminate use of the 1-2-4 mix is eliminated.

Many of the ideas embodied in the new

method of controlling concrete quality are already well known to the experienced contractor. With this background he will readily grasp the possibilities of the water-cement ratio specification. While he should become familiar with the method and the principles involved, generally he cannot afford to devote his own time to the details of proportioning.

Usually the contractor will turn over this responsibility to a subordinate who has been specially trained for the purpose. The volume of concrete handled will determine whether or not it is feasible for the individual contractor to employ a full-time man for concrete control.

In some cases two or more contractors can arrange to co-operate in employing a young engineer who has had in addition to actual construction experience a thorough training in the practical details of concrete proportioning.

Contractors' associations might render a valuable service by employing a full-time man to design concrete mixtures and supervise control of concrete quality for those members who desire this assistance. During the past few years this training in the application of the water-ratio method has been taught to a large number of engineers and concrete workers. The theory of the subject should not be limited to those computing specifications, but should be in the hands of the man on the job. There is at present a large number of men who are competent to handle this work. Adoption of the new methods is taking place so rapidly, however, that this number is inadequate to meet the demand of the construction industry.

Free Education for Your Superintendents

In order to assist organizations who wish to employ full-time engineers for this purpose, the Portland Cement Association is prepared to give a course of intensive training to groups of three or four such men who can be assembled at the Association's laboratory in Chicago. At least three days will be granted in the order in which they are received.

As soon as a sufficient number of requests have been received these organizations will be advised to send their representatives to Chicago. In order to take care of those organizations which are located at some distance from Chicago, the instructor may be sent to some centrally located city where a larger group of representatives can be assembled. These men should be carefully selected in order that they will be able not only to supervise quality control but also to pass the information along to foremen, mixer men and others of the contractors' organizations who are in charge of concreting operations.—*The Associated Contractor.*

At a recent meeting of the Cleveland Chapter of the American Institute of Architects, Dalton J. V. Snyder, A. I. A., of Detroit, one of the directors of the Institute, spoke on the subject of the architect's duty to his community. The point of Mr. Snyder's remark was that while the architects as a class have been unselfish and, in fact, even prodigal of their time and money, where the direct affairs of their profession are concerned, they have been extremely backward in promulgating a proper understanding and appreciation of architecture on the part of the public.

Snyder believes that the architects of the country have for years been telling each other what a great profession architecture is, how fine it is to appreciate good architecture and how much architecture enriches life, but have neglected the task of enlightening the public as to what is and what is not good architecture. Without doubt the entire profession realizes the truth of Snyder's statement. We are all familiar with the loyal and unselfish efforts which the architects of this country have for years been making along the line of training architectural students. We are all familiar with the fine illustrations of beautiful architecture which fill our professional magazines (which practically no one sees but the architects themselves) and we are all familiar with the many fine articles which are written on the appreciation of architecture, both in the general and in the specific, in these same professional magazines, which no one but the architects have a chance to read because the circulation of a professional magazine is practically limited to members of the profession.

If architecture truly enriches life and every architect worthy of the name sincerely believes that it does, then it is the duty of the architectural profession to be constantly active to the end that our national life as a whole be enriched because of a widespread popular appreciation and enjoyment of architecture.

The public is the consumer of this commodity called architecture. It is the lay public which constitute the owners and builders of our structures, whether the small house or the towering office building, the factory or the play house, the Governmental building or our places of worship. The architect is but the servant of this public and as long as the public or any part of it cannot distinguish between architecture and ugliness and, as in many cases, through ignorance actually believes an ugly thing to be beautiful, then architecture cannot truly flourish. But when the public become thoroughly sensitive to beauty and when the ability to discriminate becomes general then there will be no market for the crude, ugly product of the unqualified designer and good

architecture will come into its own.

To whom then should the public look for instruction and guidance in its effort to acquire an appreciation of architecture if not to the architects themselves?—*Builder's Weekly.*

STANDING COMMITTEE RECOMMENDS ADDITION FOR SIMPLIFIED PRACTICE RECOMMENDATION ON PAVING BRICK

Because of the increased demand for an eliminated size paving brick, the Permanent Committee for Simplified Practice Recommendation No. 1, Vitri-fied Paving Brick, has recommended to the industry that the wire cut lug brick (Dunn) 3 x 3½ x 8½ be reinstated as a standard type, according to the Division of Simplified Practice of the Bureau of Standards, U. S. Department of Commerce.

This size brick was eliminated from the recognized standard sizes on March 20, 1925, but the shipments for this size during the past three years has gradually increased until today it represents 14.5 per cent of the total based upon the survey of the industry in 1928. By the inclusion of the size into the simplification program, the Division of Simplified Practice stated that the degree of adherence to this recommendation is increased from 70.1 per cent to 84.6 per cent. There are now 6 standard, or recognized sizes of vitrified paving bricks.

In making this announcement the Division of Simplified Practice pointed out that the paving brick simplification was one of the initial projects developed by industry under the cooperation of the Department of Commerce. Much of the success attained by the program has been due to the support it has received from the Standing Committee and the National Paving Brick Manufacturers' Association.

The Division of Simplified Practice is the only organization engaged in waste elimination, through simplification and standardization, that subjects the effected programs to stipulated review, in order that they may be revised or modified in order to keep them abreast of current developments in the industry.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

"ANTI-HYDRO" Keeps this Fire House Dry

Originally the basement in this building leaked badly. Water seeped through the walls below grade. Two different types of waterproofing were tried, but neither stopped the water.

Then a cement plaster coat, mixed with "ANTI-HYDRO," was applied on the inside of the brick walls below grade. The result was both immediate and permanent. Not another drop of moisture has ever penetrated through the walls. This job was so entirely satisfactory that "ANTI-HYDRO" was recommended by the engineers for all their waterproofing work.

You can always depend on "ANTI-HYDRO" regardless of how extreme the water conditions may be. And "ANTI-HYDRO" hardens concrete in addition to waterproofing it—all in **one operation**. Being a liquid integral compound, it is extremely easy and economical to use. Mixes readily with the gauging water without the aid of skilled labor.

For twenty-five years "ANTI-HYDRO" has proved its dependability on every type of concrete waterproofing and hardening work. Results are guaranteed permanent. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Owners, United States Government, Washington, D. C. Painting, carpentry and mill work, metal ceilings, brick work, plumbing, electric work, heating.

Road Work, Delaware. Low bidders. Owners, State Highway Department, Dover, Del. Contract 125, Hazlettville-Dover, 6.90 miles. George & Lynch, Dover, Del. Stone, \$50,442; slag, \$43,822.

Contract 126, Flowers Station-Maryland Line, 3.97 miles. Field, Barker & Underwood, Commercial Trust Building, Philadelphia. Stone, \$34,169.50; slag, \$26,499.50. W. W. Truitt, Lincoln City Del., stone, \$34,143; slag, \$29,743.

Contract 127, surface treatment, 26 miles. A. Lee Orrell, Odessa, Del. (A) \$8,170.20, (B) \$6,827, (C) \$8,735.

George Howe and William Lescage announce the formation of a partnership for the general practice of architecture under the firm name of Howe & Lescage, 414 South Nineteenth Street, Philadelphia. Phone, Pennypacker 1358.

Miscellaneous Contracts Awarded

Plant, Baltimore, Md. Contract awarded Frainie Brothers & Haigley, 19 West Franklin street, Baltimore, Md. Architect, Henry Manley, 5 East Fifty-third street, New York City. Owners, Proctor & Gamble Manufacturing Co., 906 Broadway, N. Y. Reinforced concrete, brick, cast stone, steel, slag, concrete and wood deck roof, concrete and pine floors, plumbing, electric light, excavation, hollow tile, membrane waterproofing, safety treads, area gratings, iron stairs, kalamein doors, steel sash, steel partitions, mastic floors, wood block, magnesite floors, rolled steel skylight, asphalt asbestos roofing. Power building, 2 stories, 102x37 feet. Chipso building, 3 stories and basement, 168x98 feet. Bar soap building, 3 stories and basement, 309x99 feet. Warehouse, 3 stories, 254x98 feet. Heater building, 2 stories, 52x23 feet.

Dormitory, Frederick, Md. Contract awarded Lloyd C. Cullor, Fredereick, Md. Architect, J. B. Hamme, 31 West Market street, York, Pa. Owners, Hood College, J. H. Appel, president, Frederick, Md. Brick, steel, 4 stories, 50x156 feet, slate roof, composition floors, central heat, electric light.

School, Wilmington, Del. Contract awarded H. John Homan Co., Eighteenth and Cherry streets, Philadelphia. Architects, Guilbert & Betelle, Chamber of Commerce, Newark, N. J. Owners, Delaware School Auxiliary for St. Elizabeth's Roman Catholic Church, Rev. William Temple, DuPont Building, Wilmington, Del. Brick, steel, 2 stories and basement, 226x78 feet, wing 75x45 feet, slag roof, rolled steel skylights, excavation, reinforced concrete, limestone, bluestone, metal lath, plastering, tile work, terrazzo work, ornamental iron work, safety treads, metal toilet partitions, hardware, painting, glazing, steam heat, electric work, plumbing, ventilating system.

BUILDERS PROPOSE MID-SUMMER CONFERENCE

A midsummer conference of representatives of Builders' Exchanges throughout the country is being promoted by the national association of Builders' Exchanges to be held in Omaha, Neb. The purpose of this conference will be to consider existing conditions in the building industry and ways and means of improving the same on behalf of those engaged in this line of business, with special reference to contractors and sub-contractors. Notices for the meeting has been sent out

from the national headquarters in Washington. It is expected that the session will cover several days and be productive of recommendations to the various affiliated bodies.

UNCLE SAM PLANS TO KEEP WORKERS COOL

*Will Provide Air Conditioning In All
Federal Buildings; Washington
Fights Heat*

Uncle Sam is going in for air conditioning of all his public buildings on a big scale.

Excessive moisture will be taken out of the air of office buildings in Washington during the hot days this summer and a constant change of cool air provided for the thousands of government workers who have sweltered in previous years, it is announced. Modern ventilating systems are being installed in even the oldest buildings, while new structures will be equipped with the latest in air conditioning. This will make it possible, too, to humidify heated dry air during the winter months, according to Major S. M. Corbett of the Army Medical Corps who is in immediate charge of the work with the assistance of the industrial hygiene division of the Public Health Service.

Thousands of government workers are quartered in temporary war buildings of light wood construction with tarred roofs and these buildings are sometimes veritable furnaces in summer. Several times last year it was necessary to suspend work because the heat was unbearable. This year, especially designed machinery will be used to dehumidify the atmosphere, making the high temperatures bearable. Tests conducted by the Public Health Service definitely demonstrated that air conditioning greatly improved the efficiency of workers.

"We found that the efficiency and health of workers are greatly improved and that there is also less loss of time from sickness and a definite saving of fuel where the proper relative humidity and amount of air motion is maintained,"

Major Corbett said. "There is also less deteriorating of furniture, fabrics, paintings and books.

"Another feature of air conditioning and nearly as important as humidifying is dehumidifying. An excessive moisture is about as vicious as too little moisture. Our hot, muggy days in this climate are caused principally by a high relative humidity or excessive moisture.

"High temperatures reduce efficiency so far as human beings are concerned. They slow down some of the more important physiological functions of our bodies and increase the tendency to disease. Hospitals, in my opinion, would be greatly benefitted by humidifying the air in winter and dehumidifying in summer. Moist air in operating rooms would reduce the liability to explosions of the ether by sparks caused by static electricity.

"It would provide greater comfort for all patients, especially those suffering with respiratory affections. Every one knows the efficacy of the croup kettle, which is nothing more than a humidifier with some medication added. In summer, if the air in hospitals was dehumidified and cooled, patients would not only be more comfortable, but recovery would be expedited. Metabolism is sped up, the body functions more efficiently and resistance to disease is increased."

In many cities throughout the country where new post office and other federal buildings are being constructed, air conditioning will be provided, the government engineers have decided. More modern methods of ventilating government hospitals and penal institutions also will be adopted, it was stated. A new federal building to be erected shortly in Toledo, for example, will have as modern an air conditioning plant as any theatre, big department store, or latest type of commercial office building.

KNOTTY WOODS AGAIN COMING INTO FAVOR

Imitation is a sure sign of appreciation and it is but a short step from the growing admiration for the old time rooms paneled in knotty pine, to the present day fashion which favors the skillful use of other woods containing charming variations in grain effect.

This may seem to be something of an innovation, for except in the case of the cedar chests, which are so often seen in bedrooms and halls, and are always liberally bespeckled with knots, clear wood had come to be considered essential.

But an inspection of old furniture and the interior trim in rooms of other days, reveals that this has by no means always been the case. In fact, many examples of the use of knotty wood can be found, and when skilfully done, the effects are most interesting. The present tendency to use knotty wood is, therefore, not new,

but is rather a harking back to an older fashion.

Supporting and emphasizing this trend of taste are the very real advantages of conservation of wood resources and reduction of construction costs. It is this angle of the subject that is emphasized by the National Committee on Wood Utilization, which operates in connection with the Federal Department of Commerce. As this committee points out, small, tight knots do not mean defects either in beauty or strength, and the difference in cost between clear grades and those having a few tight knots as much as 50 per cent.

This is a real item in the cost of building. For instance, the growing practice of using knotty American walnut for the portion of a floor normally covered by rugs reduces the cost, making it economical to use this exceptionally attractive and desirable flooring, whereas, if nothing but the clear grade were used, the cost would be too great. The same is true of interior trim. The grain effects in knotty walnut are most interesting and such wood is being used for this purpose with very satisfactory results and at a cost which permits the use of this exceptionally beautiful wood, even in homes of very moderate price.—*Builder's Weekly*.

A NEW "REINFORCING" PLASTER BASE

Ribbed Steeltex for Plaster, the latest development of the National Steel Fabric Company of Pittsburgh, Pa., solves the last of the practical application problems of plaster reinforcement. The original Steeltex for plaster, which achieved such wide acceptance by architects, building owners, and the trade generally, consisted of a welded and galvanized wire mesh with a heavy waterproof backing. This backing automatically formed a monolithic plaster slab solidly reinforced with strong steel bars, like steel reinforcement in concrete. It also damp-proofed the plaster and added a measure of insulation and sound-proofing value.

Ribbed Steeltex, while generally similar to the earlier product, incorporates several improvements which raise the level of its efficiency far above that of the older form. Horizontal V-shaped steel ribs have been added to stiffen the sheet, which lies perfectly flat, without bulges or hollows that waste plaster, and requires no stretching or toe-nailing. The ribs are strong and rigid, and yet they are readily cut with ordinary hand shears and may be bent to fit the material in corners or on curved surfaces. When the sheets are cut the edges remain smooth and do not injure the workman's hands—a feature keenly appreciated by the lathers.

The backing of the improved Steeltex for Plaster has been greatly increased in

weight. The sheets are now standard size, 50x28½ inches, and they are packed in strong fibre-board cartons containing 50 square yards.

The National Steel Fabric Company followed closely the specifications of practical plasterers, lathers, contractors and architects in developing this new Ribbed Steeltex for Plaster. So that there would be no question as to the ultimate result, thousands of yards were made by hand and were successfully used in all types of buildings before even one machine was built. After repeated tests with the hand-made product, followed by installations of the first machine-made product (which resulted in a flood of repeat orders far exceeding the capacity of the first units), the National Steel Fabric Company installed a huge battery of new fabricating machines to meet national distribution requirements before offering the new Steeltex to the trade.

The simple changes which resulted have brought more economical and faster handling of the material on the job and have increased the speed at which the plaster can be applied. The sheets are easily handled by one man and are quickly attached with common 4d nails.

Lathers who have applied this material, without previous experience, find it saves them effort and goes up as rapidly as any other plaster base. Plasterers agree that this stiffened Steeltex takes the scratch coat quickly on ceilings as well as walls and save plaster. In this respect tests on actual jobs show it to be the best working plaster base on the market by far.

Under plasterer's trowel this improved Steel tex presents a surface of board-like rigidity due to the heavy backing and stiffening ribs. Plaster is applied with economy of effort and without waste; and at the same time it is both mechanically bonded and structurally reinforced. It is not merely a veneer (as over wall-board) depending for its strength on its own adhesive properties. The finished plaster wall is stiffer than one with metal or wood lath as a base, and is superior because the reinforcement is in the heart of the plaster and because the heavy backing adds extra values without cost.

The improved Steeltex for Plaster is finding a ready and enthusiastic market, as it retains all of the recognized superiorities of the original Steeltex and simplifies its handling and application for the common benefit of the lather, the plasterer, and the owner.

A certain wallboard man advertised in the Guide for awhile and then dropped out. We've had a dozen inquiries since then, asking for his address—every inquiry from a cash buyer. This is a common occurrence. It's hard to make some advertisers see the vital importance of a standing "ad."

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

"ANTI-HYDRO" Keeps this Fire House Dry

Originally the basement in this building leaked badly. Water seeped through the walls below grade. Two different types of waterproofing were tried, but neither stopped the water.

Then a cement plaster coat, mixed with "ANTI-HYDRO," was applied on the inside of the brick walls below grade. The result was both immediate and permanent. Not another drop of moisture has ever penetrated through the walls. This job was so entirely satisfactory that "ANTI-HYDRO" was recommended by the engineers for all their waterproofing work.

You can always depend on "ANTI-HYDRO" regardless of how extreme the water conditions may be. And "ANTI-HYDRO" hardens concrete in addition to waterproofing it—all in **one operation**. Being a liquid integral compound, it is extremely easy and economical to use. Mixes readily with the gauging water without the aid of skilled labor.

For twenty-five years "ANTI-HYDRO" has proved its dependability on every type of concrete waterproofing and hardening work. Results are guaranteed permanent. Use it on your next job.

COMPO BOARD is
composed of three
parts:

Nos. 1 and 5 are a specially
prepared tough covering.

Nos. 2 and 4 are a strong,
waterproof cement.

No. 3 is wood slats, which
are thoroughly dried and put
together indiscriminately as to
grain.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves" — Force Feed Lubrication — Counter balanced Crankshaft — all-steel Welded Frame — these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

METALWELD, Inc.
26th and Hunting Park Avenue, Philadelphia

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Building, Washington, D. C. Contract awarded Charles L. Stackhausen Co., Gay and Water streets, Baltimore, Md. Architect, C. B. Comstock, 110 West Fortieth street, New York City. Owners, General Baking Co.,

420 Lexington avenue, New York. Brick, reinforced concrete, steel, 2 stories and basement, 240x162 feet, slag roof, cement floors and concrete work, rolled steel sash, ornamental iron work.

Store and Apartment, \$5,000. Seventh and King streets, Wilmington, Del. Contract awarded Samuel Kohn, 801 West Nineteenth street, Wilmington, Del. Architect, private plans. Owner, Henry Harris, 2307 Harrison street, Wilmington, Del. Fire repairs, fire escape.

Residence and Garage, \$5,350. New Castle street, Wilmington, Del. Contract awarded Domenick Cantera, 1504 Pennsylvania avenue, Wilmington, Del. Architect, private plans. Owner, Mary Demenchick, care of builder. Concrete block, brick, 2 stories, 16x42 feet, composition roof, pine floors, hot air heat, electric light.

Residence (alts. and add.), Weldin avenue, Wilmington, Del. Contract awarded W. D. Haddock & Co., 804 Orange street, Wilmington, Del. Architects, Pope & Manning, Equitable Building, Wilmington, Del. Owners, F. C. Zeisberg, care of architects. Frame, stucco, 2½ stories, irregular size, shingle roof, hardwood floors, tile work.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., June 18, 1929. Sealed bids will be opened in this office at 3 p. m., July 22, 1929, for extension and remodeling (except elevator) of the U. S. post office at Watertown, N. Y. Drawings and specifications, not exceeding six sets, may be obtained at this office in the discretion of the supervising architect by any satisfactory general contractor, and provided a deposit is made of \$25.00 for each set to assure its prompt return. Checks offered as deposits must be made payable to the order of the Treasurer of the United States. JAS. A. WETMORE, Acting Supervising Architect.

HOW BUILDING MATERIAL MANUFACTURERS SELL STOCK DESIGNS TO ARCHITECTS

By ALFRED E. FOUNTAIN, JR., *Division
of Architecture & Building
Lyddon, Hanford & Kimball, Inc.*

Reprinted from *Printer's Ink*, May 9,
1929 Issue

In those days that someone dubbed "Late Grant," meaning the Mauve Eighties, American architecture received its first real impetus. Our cities started to grow and expand into suburbs. America began to look to its comfort in housing. Architecture bestirred itself from its long lethargic sleep and started on its great upward sweep toward today's practice.

Quite naturally, the new and keenly awakened minds of architects began to look with horror on those long years of architectural monstrosities—the scroll-saw house and its ideas of stock design. And so was born the modern architect's distaste for all stock design.

In the early part of the present century, so acute had this aversion become that it headed architecture toward a most

uneconomic condition—that of over-emphasis on minute refinement. Every last moulding must be detailed and full-sized, shop drawn and redrawn, until the average architectural fee vanished in clouds of tissue and blueprints.

When mass production in architecture with its ever-increasing demands on the architects arrived, it became obviously impossible for an office, run for a profit, to render this tremendously costly service. Some relief must be had. It became a question either of recourse to the material manufacturers' stock design (usually made for small-town dealers and more often than not atrocious in design) or a new standard of design evolved by the architect himself.

Many progressive manufacturers seized this wonderful opportunity for architectural preference and began, in close co-operation with architects, to revamp their stock designs to meet the most critical tastes. But you can't breed out of a professional artist in a few years the dislike that has grown up in him over two or three decades, so that today the word "stock" prefixed to any design is pretty apt to build up a sales resistance in selling the architect.

But for the last twenty years or more, a great many artistically inclined or architecturally trained men have drifted into the manufacture of building products. They have applied their good tastes and their practical experience to the artistic refinement of their product. Many companies have retained well-known architects to design their entire lines. Others maintain architects on a fee basis for advice on the subject of design. Then there are manufacturers who specialize in the reproduction of old or antique products who have sent men abroad to make exact copies of recognized masterpieces. The result is that the poorest stock design today is in far better taste and, incidentally, far more practical, than the best of them thirty or forty years ago.

So one of the many problems that faces the building trades manufacturer of today is how to sell his stock designs to the architect.

A Problem in Economics

This problem does not arise from any desire on the part of the manufacturer to force cheap or inferior materials on the architect. It does not even mean that the manufacturer will make any greater immediate profit from his sale. It is a sheer problem in economics. The manufacturer knows he has a practical and beautiful article. He knows of the growing demands for quick delivery and the economies of mass production. And finally he knows that the cheaper he can sell his product and the cheaper he can make it for the architect to use it, the cheaper

it will be for the owner and the greater its use in construction.

I have been through the plan files and model rooms of many manufacturers who for years have done work for the very best architects in the country. Most of them have literally thousands of dies, models or plans of surprising beauty—that have been evolved and slaved over by the master minds of design. They have been produced to meet almost every conceivable architectural problem. And each costs anywhere from \$20 to \$500 according to the type of product and whether plan or steel die.

Several years ago a manufacturer of cast metal grilles estimated that he had accumulated over a long period of time several hundred thousand dollars worth of dies designed by the world's finest designers. If these could be put into use again (and why not, for who except in rare instances can recognize a grille no matter how large or beautiful) the saving in dollars and time would be enormous. In spite of the fact that most of these designs remained the property of the architect who created them, or the owner who paid for them, this manufacturer secured their release from their owners and offered them to the entire architectural profession.

Another manufacturer of drawn metal shapes recognized the same condition and is laying extensive plans to effect the re-use of his dies with its consequent saving.

There are, of course, manufacturers of stock products which are so easy to visualize to the architect that the sales problem is not serious. A maker of stock woodwork and trim, for instance, has a relatively simple problem. The utmost decorative possibilities of wood are known to the architect. A simple accurate visualization will tell the whole story. But this is not true in the stones, natural or artificial, the metals and other products that are not so intimately known as that have not been so intensively studied as woodwork.

There are, too, many products whose designs have for years been accepted as inevitable. Their sales story does not fall within the province of this article which considers only articles in which there is a latitude in design allowable. Plumbing fixtures might for example be classed with products that allow scant scope for the designer. Seemingly, their mechanical requirements have outweighed the desire for beauty and but little refinement has been attempted. There has been, however, a great change in this respect within the past few years, since beauty is now demanded in bathrooms as well as in every other part of the house, and it is conceivable that before long plumbing fixtures will also be sold on the basis of design.

However, the selling of stock materials, whether structural or decorative, to the

most aesthetic and particular architects, has now been so often successfully accomplished that it is safe to predict that it can be done by almost any company which will approach the problem with a full realization of the architect's problems in mind.

Not long ago, in a conversation with one of the deans of architecture, I brought up this question of stock design. His analysis of the case is in substance as follows: The modern architect is so engrossed in the business side of his profession—finance, management, promotion, etc.—that he has but little time to spare for the problems of refinement in design. The greatest help that a manufacturer of building products can give architects is by first producing really worth-while stock designs and second by showing architects that they are beautiful and suggesting ideas for their use.

The American Brass Company has for years produced extruded bronze shapes for fabricating bronze doors, bank screens, elevator doors, etc. Each of these shapes were specially designed and had dies made for its production. The design and die were usually used but once, then stored away and forgotten. Finally, a great many hundreds of these dies accumulated. The problem was how to make use of them with the resultant saving of time and money.

What the company has done is to consolidate this vast accumulation of original designs and publish a book showing the shapes available for re-use without the added cost of new designs and dies.

This book seemingly solved only part of the problem because it demanded so much of the architect's time and ingenuity to go through it and select such designs as he could use. Furthermore, remember that the average architect is prejudiced against all stock design and his casual study of this seemingly uninteresting tome confirmed his fears.

But with a sure insight into the architect's mind, the American Brass Company turned this book into one that architects would find invaluable. As most designs are based on the adaptation of a precedent and as most bronze work that can be photographed contains shapes not available as stock, or which could not have the appeal of absolute originality, it was decided to have recourse to drawings. The company employed a skilled designer, authorized him to make an exhaustive study of bronze design in general and extruded shapes in particular and then to create drawings in natural colors, suggesting the uses of the shapes shown in the book. These drawings were to be original in conception, absolutely practical structurally and to suggest the probabilities of extruded shapes in both classical and modern design.

So skilful were the drawings that when bound into the book or offered separately to architects, they immediately awakened in their minds a new appreciation for extruded bronze in general and the company's stock shapes in particular. Incidentally, these drawings make splendid architectural magazine advertisements and give the company's salesmen an interesting talking point when calling on architects.

The American Enameled Brick & Tile Company has gone a long way toward solving the problem of having not only stock shapes but a very limited number of them by suggesting new and practical uses for these shapes. The general conception is that bricks can be moulded into any desired shapes. This is actually so, but it is not economically practical with an enameled brick costing 10 cents each.

An exhaustive research into brick design convinced the company that a limited number of shapes would meet every modern architectural requirement. To convince architects of this fact, the company has for the last two years been issuing each month a suggestion for brick design using only its stock shapes. While this type of advertising benefits all brick manufacturers, it has well repaid its sponsors.

The work has been a real contribution to the brick industry. The designs have evolved new methods of brick ornamentation (some so original as to be patentable). They have pointed out the great range and adaptability of brick to modern architecture. They are selling enameled brick as they never sold before.

For over sixty years a manufacturer of lighting equipment has specialized in the solution of different lighting problems—picture galleries, libraries, churches, show windows, etc.—anything that called for the unusual, spectacular or novel. Experience with hundreds of thousands of problems has resulted in a range of stock equipment that will fill the average need for show window illumination.

The advertising problem here is particularly difficult because display illumination is bought solely for the effect it will create. Quantity of light does not count nearly so much as quality of color and the elimination of shadows. As the average architect has very little conception as to what a given piece of electrical apparatus will do in this respect he has to be shown what it will do.

Photographs of actual windows illuminated by the manufacturer will not do because of the mechanical difficulties. Taking pictures through plate glass will not result in showing the refinement of the window lighting. Apparently only extraordinarily carefully conceived drawings will solve this problem. A campaign has been prepared based on drawings of windows specially designed by a recognized expert. These designs are then rendered

by an artist adept in the portrayal of light effects. Then to add authenticity, credit for the display is given to some prominent store designed by a well-known architect, where the manufacturer's equipment has been installed.

I could tell a dozen other instances of the successful selling of stock designs to architects. Many hardware manufacturers have been particularly successful as have makers of casement sash, rubber flooring, and the like.

Then, too, there is the evidence of the paint manufacturers and the like who have engaged in the nearly won battle to establish stock colors. But this leads to another and perhaps more intricate part of architectural selling so it can be only hinted at here.

Stock design is so economically sound that in time it will be the accepted thing. Right now, architects object to it but tell us they must accept it. And the proved way to make them accept it without resistance is, first, to be sure the designs are sound in every way. Then to show them to the architect *in situ* so that he can visualize the product in use. Sometimes photographs will accomplish this but by far the best way is to use the architect's own medium—drawings.

In this way, you can place your product where you want it, in the type of building in which you would like to sell it. And best of all you can suggest its use in modern architecture or decoration. Then, too, you will find that by using drawings for general visualization you can quite gracefully introduce selling points in the shape of details that tell more of your product than reams of type.

GIVE MR. HOOVER A CHANCE

"What does business expect of Hoover?"

The answer to that question can be put in two words, "too much."

We have had a long occupancy of the White House by "a statesman whose watchwords have been 'caution' and 'economy.'" His was a task of letting the country find itself after the great convulsions of war. Business seems to have been in general agreement that he did the job well.

The pressure on Mr. Hoover is to "do things," to be a "constructive" president. He goes to Florida and is urged to ask Congress to finish a partly done drainage project; strong pressure is brought upon him to speed up the creation of a great reserve fund for public works that unemployment may be prevented; a tariff having been suggested as one means of helping the farmer the cry is insistent in some quarters that the whole tariff be done over.

Already the press that opposed Hoover is saying that before the end of the first

year of the new administration there will be a threatened deficit and a cry for an increase in federal taxes.

Some of the overenthusiastic friends of the president-elect might well restrain their enthusiasm and quiet their cries that "something should be done."

President Coolidge once said that worse things might happen to an administration than *not* to be on the front page. Disaster happens more often from being too fast than from being too slow.

Mr. Hoover's friends might well quiet their fear that some one will hurl at him the deadly phrase "he isn't constructive" and let him work out his own plans in his own way and at his own time.—*East Bay Builder*.

QUALITY IN ROOFING IMPORTANCE

Many miles away, as one approaches a town, we note how conspicuous are the roofs and church spires against an almost solid blue-green background.

Most of us recall the days when these roofs were hardly without exception of natural blue-gray slate, suggestive of the ruggedness our forefathers observed when designing and building their homes. These roofs endured years with no attention whatever. When once applied they were entirely forgotten.

In some communities vivid penetrating color later found its way both in natural slate and in manufactured roofing materials. A choice of every known shade became available to appease the public taste, often with the result that the less scrupulous builder was tempted to give color, but, unfortunately, disregard quality.

However, the fallacy of such practice is now being felt. The annoyance and expense of upkeep has injected much seriousness in the thoughts of the home owner or buyer.

Thus we are back where we started—and a bit wiser. Color is desirable.

—*East Bay Builder*.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—*Elbert Hubbard*.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

"ANTI-HYDRO" both hardens and waterproofs stucco in *one operation*. It prevents stucco from chipping, crazing, map-racking and discoloration, and insures a dry interior at all times. The admixture of "ANTI-HYDRO" makes portland cement bond securely to tile, brick or concrete. Any tone may be obtained through the addition of a dry mortar color, or it may be used with pure white cement, without dimming or changing the color. "ANTI-HYDRO" is a liquid integral compound. It mixes readily with the gauging water—any unskilled workman can do it. For 25 years it has proved its superiority. Use "ANTI-HYDRO" on your next job for permanently hard and waterproof stucco work.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

TELLING LEADS TO SELLING

By H. A. MORSE

President H. A. Morse Inc. Advertising Counselors

Abner "Grandfather" Brown, able builder, never thought much of the advertising profession. His "craft" (as he fondly termed the construction business) needed no ballyhoo.

Yet Grandfather Brown lived to see the construction industry become the greatest contributor to our national

1530 CHESTNUT STREET

PHILADELPHIA

wealth,—largely through advertising. He saw, and grudgingly admitted that he saw, Advertising take the sprawling building business, set it to rights, make it profitable.

Through the manufacturers, dealers and the builders themselves, Advertising took an almost limitless number of methods and materials, some quack, some sound, placed them in the spotlight of public opinion—and, briefly, reached a point of standardized practice and products. It gave the public a measuring stick to use methods and materials of approved value. And it gave those builders a broader field of action. It assured them of quality and the public did the rest.

Secondly, Advertising, traveling over its lightning route, took *new* methods and materials, tested them widely, scrapped many, established others.

Thirdly, Advertising gained recognition for those builders who had the judgment that if they would adhere to first class construction methods, the public would not take a century beating a path to their doors.

Without Advertising, construction would never have assumed such gigantic proportions. Widespread attention focused on the field has created a demand for homes, for industrial and commercial structures, unparalleled in history.

But let us assume for the moment that construction might have reached first position in our national weal without the aid of one line of advertising copy. What would be today's standards of quality? What would be the financial status of reliable contractors?

The owner, the buyer of workmanship and equipment, feels secure within the protection of far-reaching publicity. He buys with more confidence than he would have invested in Grandfather Brown in the latter's best days. Consider that Nine Billion Dollars are spent yearly by building owners, that a considerable portion of this vast sum is paid over before owners see tangible evidence of their investment. Such faith is based on the personal integrity of contractors and on trade marked materials and equipment.

Because the makers of construction tools and materials know that builders will respond to their efforts toward standardization, they have considered it wise to enhance the value of their products by further research.

If we implied that Grandfather Brown's thoughts on the Advertising profession were old-school and obsolete in 1929, that was in error. It is still not an uncommon thing to hear a successful contractor remark that Advertising has no place in the building business. While in another room, the purchasing department pores over the catalogs of national advertisers.

The construction business is entering

upon its second cycle of Advertising education. The next 50 years will find many National Contractors with National—and International—Reputations. The belief has been, and still is, that the contractor's work is local and as such, his reputation is dependant upon word of mouth publicity (and, of course, on physical proof of his ability in buildings round-about). But these barriers of geographical characteristics are being broken down; cities themselves are passing beyond the neighborly stage; it is becoming increasingly more difficult for any one contractor to make and maintain a reputation of mute testimony alone.

Builders who have ventured into self-advertising have found the way well paved. Believers in advertised products themselves on the one hand, and with millions of converts on the other, they have had only to say: "We use these products. Here are proofs of our sincerity." Few industries have had such excellent opportunities to capitalize on the guarantee of value established for them.

Grandfather Brown, back in the '80's, would have had an uphill climb convincing the natives with the printed, the spoken, and the broadcast word, that his methods, his jobs were without rival. He had little to build on; uncertified materials, unbranded equipment. Naturally, his field of activities was limited to a small geographical area where people knew him personally, had faith in him as an individual.

1929 Builders are not so handicapped. The public is product-conscious, construction-minded. Builders have merely to tie-in their abilities with their tools of performance.

Who are responsible for these changed standards? Those who knew that through the power of the printed word, thousands will react to the suggestion that new homes are infinitely superior to old. This influence on the American people, encouraging their efforts to improve present conditions, is reflected boldly in all Advertising. Construction, particularly that phase having to do with the home, has benefitted accordingly.

Manufacturers, directing their publicity through the builder, and in many cases to the home owner, have established standards for the American Home which are unmatched in history. In point of architectural beauty, convenience, time-resisting quality, home construction today far surpasses that of the '80's. Grandfather Brown would say that Advertising has brought this about by making the individual dissatisfied, eager for something better. True in a sense, but that is the spirit that has made this country the most progressive, the most forward-looking in the world.

In commercial work as well, the knowledge that better equipment, more com-

modious and efficient quarters, could be had, as broadcast in advertising messages, has created demands for new buildings: new business for the contractor directly attributable to advertising.

No one knows better than the contractor's own purchasing department how synonymous are trade-marked products with good construction. The new element in the construction business, the sales promotion department, will find an ally here. And on the organization chart here, we have taken the liberty of hooking-up these two functions in the interests of a more profitable construction business.

Acknowledgments are hereby given to Everett Winters Co., aggressive builders, and to Cutler-Hammer, Inc., for their kind, if unsolicited, permission to reprint portions of their material.

—Building Age.

CENTER FIXTURES GIVE BEST RESULTS

Nearly all women indulge in frequent rearrangement of furniture. Lighting in relation to such changes is important. Center fixtures in all rooms of the home quite logically give best results in uniform and even distribution of illumination throughout a room. Certainly the man who wires for a center fixture, even though it may not be installed when the house is built, will not regret it, and he will undoubtedly install it at a later time.

Although most of us live under the light of our portable lamps, it is highly inadvisable to install lighting that depends wholly upon lamps. With fixtures to provide for widespread general illumination and lamps adding the "local" lighting and harmonious note of decoration in the shades they carry, satisfactory results will be had if thought is given their placement.

Convenient outlets placed in the baseboards of the living room, halls and bedroom will hide the attachment cords of the portable lamps for which they are largely used.—East Bay Builder.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public associations tending to overcome the natural habit of procrastination.—Making advertising pay.

"Camouflage" doesn't pay in advertising. Don't call your cannon a bit of landscape. Be honest and gain the confidence of the public.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

ON-THE-
HUDSON, N. Y.

V. W. TANDY,
ARCH.

MILLER,
REED & CO.,
BUILDERS

"ANTI-HYDRO" both hardens and waterproofs stucco in *one operation*. It prevents stucco from chipping, crazing, map-racking and discoloration, and insures a dry interior at all times. The admixture of "ANTI-HYDRO" makes portland cement bond securely to tile, brick or concrete. Any tone may be obtained through the addition of a dry mortar color, or it may be used with pure white cement, without dimming or changing the color. "ANTI-HYDRO" is a liquid integral compound. It mixes readily with the gauging water—any unskilled workman can do it. For 25 years it has proved its superiority. Use "ANTI-HYDRO" on your next job for permanently hard and waterproof stucco work.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

METALWELD, Inc.
26th and Hunting Park Avenue, Philadelphia

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Y. W. C. A., Coatesville, Pa. Contract awarded W. J. Elliott, Coatesville, Pa. Architects, Magaziner, Eberhard & Harris, 1701 Walnut street, Philadelphia. Owners, Y. W. C. A., care of Miss May Penman, Coatesville, Pa. Brick, steel, reinforced concrete, 3-stories and basement, 46x80 feet, slag roof, maple and pine floors, plumbing, roof ventilators, ornamental iron work, cinder concrete blocks, caulking, steam heat, electric light, metal lath, tile and marble work, rolled steel skylights.

Residence and Garage (alts. and add.), Rayham road, Merion, Pa. Contract awarded F. B. Davis & Son, 240 North Sixteenth street, Philadelphia. Architect, Ralph E. White, 1518 Walnut street, Philadelphia. Owner, Roy Bookmeyer, Merion, Pa. Stone, hollow tile, stucco, 2½ stories and basement, 18x12 feet, slate roof, wood deck roof, oak and pine floors, plumbing, painting, glazing, hardware, electric light, metal lath, tile work, bond, ornamental iron.

Residence and Garage, Lot No. 164, Sheffield avenue, Overbrook Hills, Pa. Contract awarded C. C. Pace, Cynwyd, Pa. Architect, T. B. Lippincott, 11 South Sixteenth street, Philadelphia. Owner, Miss Emma M. Haig, Ardmore, Pa. Brick, steel, 2½ stories and basement, 18x38 feet, shingle roof, oak and pine, cement floors, plumbing, hot water heat, electric light, tile work, metal lath, bond, ornamental iron work.

Residence (alts. and add.), Valley Forge, Pa. Contract awarded Clark & Harvey, Packard Building, Philadelphia. Architects, Ritter & Shay, Packard Building, Philadelphia. Owner, Joseph Neff Ewing, Valley Forge, Pa. Stone, 2½ stories and basement, 44x31 feet, shingle roof, oak, pine floors, excavation, painting, glazing, cement work, stone masonry, iron work, screens, plumbing, hot water heat, electric light, marble and tile work, flagstone, metal lath, plastering.

Residence and Garage, Villa Nova, Pa. Contract awarded W. D. Lukens, North Wales, Pa. Architect, G. Edwin Brumbaugh, Real Estate Trust Building, Philadelphia. Owner, Warren C. Graham, Fox Building, Philadelphia. Stone, 2½ stories and basement, 89x30 feet, slate or shingle roof, pine, oak, cement

floors, tile work, bond, ornamental iron work.

School, York Springs, Pa. Contract awarded Luther Sachs, Gettysburg, Pa. Architect, B. E. Starr, 9 North Second street, Harrisburg, Pa. Owners, York Springs School Board, A. T. Bennett, York Springs, Pa. Brick, steel, 1 story, 33x130 feet, composition roof, maple floors (heating, plumbing and electric separate).

Residence and Garage (alts. and add.), 216 Wynecote road, Jenkintown, Pa. Contract awarded Roy Randall, Jenkintown, Pa. Architect, Philip S. Tyre, 114 South Fifteenth street, Philadelphia. Owner, Walter A. Conlan, on premises. Brick, 2½ stories and basement, hot water heat, alterations, electric work, alterations, metal lath, tile work, shingle roof, oak and pine floors, plumbing, plastering, painting, glazing.

College (add.), Rydal, Pa. Contract awarded Henry Specht, Willow Grove, Pa. Architect, Horace Trumbauer, Land Title Building, Philadelphia. Owners, Ogontz School, Rydal, Pa. Stone, 2½ stories and basement, slate roof, oak and pine floors, steam heat, electric light, metal lath, bond, ornamental iron work.

Convent, Bridgeport, Pa. Contract awarded C. D. Burns, Bridgeport, Pa. Architect, Peter F. Getz, Victory Building, Philadelphia. Owners, Our Mother of Sorrows Church, Bridgeport, Pa. Stone, steel, 2½ stories and basement, 30x47 feet, asbestos shingle roof, oak and pine floors, steam heat, electric light, ornamental iron work.

Church, Lansdowne, Pa. Contract awarded E. E. Hollenback, Inc., 1910 North Marshall street, Philadelphia. Architect, C. P. Berger, 1512 Walnut street, Philadelphia. Owners, St. Paul's Evangelical Lutheran Church, Lansdowne, Pa. Stone, 1 story and basement, 80x45 feet, asbestos shingle tile roof, cork tile floors, plumbing, bluestone, steam heat, electric light, fire doors, bond, ornamental iron work, excavation.

Residence and Garage, Drexel Park, Pa. Contract awarded B. J. Campbell, Flanders road, Philadelphia. Architect, Harold E. Williams, Drexel Hill Park, Pa. Owner, Sarah I. Cosgrave, care of architect. Stone, steel, 2½ stories and basement, 55x31 feet, garage 20x27 feet, shingle roof, oak and pine, cement floors, plumbing, metal weather strip, hot water heat, flagstone, electric light, metal lath, tile and

marble work, bond, ornamental iron work, area gratings, plumbing, insulite.

Store and Office (alts. and add.), 20½ North Queen street, Lancaster, Pa. Contract awarded W. B. Aierstuck, 34 East Chestnut street, Lancaster, Pa. Architect, H. Y. Shaub, 20½ North Queen street, Lancaster, Pa. Owner, B. W. Shaub, 445 College avenue, Lancaster, Pa. Stone front, brick, 3 stories, 30x40 feet, composition roof, hardwood and linoleum floors, heating extension, electric lighting, tile, marble, casement windows, bronze work.

Comfort Stations (2), Concession Office, Secretary's Office and Ticket Office, Reading, Pa. Contract awarded Fink Construction Co., 510 Walnut street, Reading, Pa. Architect, C. J. Young, 226 North Sixth street, Reading, Pa. Owners, Reading Fair Co., A. Deysher, 522 Court street, Reading, Pa. Frame and cinder block, 1 story, 20x20 feet, 14x16 feet, 20x30 feet, 8x10 feet, asbestos shingle roof, pine floors, electric light, concrete floors, steel sash.

Residence, East Petersburg, Pa. Contract awarded George Beamsderfer, Landisville, Pa. Architects, Jamison & Minick, 23 North Third street, Harrisburg, Pa. Owner, M. S. Sahn, 931 North Third street, Harrisburg, Pa. Brick, 1 story, hardwood floors, electric light, tile work.

Residence (English cottage type), Royersford, Pa. Contract awarded Charles Funderwhite, Phoenixville, Pa. Architect, J. Vincent Poley, 162 Second avenue, Royersford, Pa. Owner, J. Everett Yerk, 322 Walnut street, Royersford, Pa. Brick, 2 stories, 35x34 feet, black slate roof, pine and oak floors, cement block, hot water heat, electric light, metal lath and celotex, tile work, wood sash, Morgan doors.

Residence and Garage, Bryn Mawr, Pa. Contract awarded Unkerfer Brothers, Otis Building, Philadelphia. Architect, John W. Ames, 148 State street, Boston, Mass. Owner, Francis H. Bohlen, Wayne, Pa. Stone, 2½ stories and basement, 90x30 feet, slate and copper roof, oak and pine floors, bond, ornamental iron work.

Road Work, Pennsylvania. Contracts awarded. Owners, Pennsylvania Department of Highways, Harrisburg, Pa.

Northumberland County, R-182, Gearhart, Rush and Ralpho Townships. One course reinforced concrete. F. D. Kesler, Northumberland, \$446,771.86.

Clearfield County, R-57, Sec. 2, Decatur Township, Chester Hill Borough. One course reinforced concrete. Cooper Construction Co., Clymer, Pa., \$202,777.84.

Blair County, R-260, R-537, Frankstown Township. One course reinforced concrete. E. H. & L. A. Brua, Jr., Hollidaysburg, Pa., \$224,009.78.

Montgomery County, R-362, Abington Township, A-5576. One course reinforced concrete. George I. Thompson Co., Clearfield, Pa., \$42,027.24.

Washington County, R-268, Sec. 10, East Bethlehem Township, Centreville Borough. One course reinforced concrete, grading and drainage. Petriello Brothers, South Brownsville, Pa., \$56,295.94.

Tioga County, R-103, Lawrence Township, Lawrenceville Borough. One course reinforced concrete. Smouse & Kreamer, Galeton, Pa., \$153,870.02.

New Jersey Construction News

Buildings (5), Southwest Corner Haddon avenue and Old White Horse pike, Camden, N. J. Preliminary plans in progress. Architect,

name withheld. Owners, George D. Wetherill & Co., Inc., on premises.

Y. M. C. A., \$50,000. East Holly avenue, Pitman, N. J. Tentative plans drawn. Work contemplated. Architect not yet selected. Owners, Y. M. C. A., care of Elmer E. Long, Broadway and Federal streets, Camden, N. J. Size of lot, 225x150 feet. Will contain social, reading rooms, gymnasium, assembly room.

Home for the Aged, \$50,000. King's Highway East and New Cooper River Drive, Haddonfield, N. J. Architect taking bids due July 11th, 4 P. M. Architect, H. E. Hall, Merchantville, N. J. Owners, Order of Shepherd of Bethlehem, care of Charles E. Carr, Publicity Building, Camden, N. J. Brick, steel, 2 stories, 145x32 feet, 40x32 feet, slag and slate roof, light concrete floors, bar joist, linoleum and wood floors, metal ceilings, dumb waiter, concrete foundations, vapor heat, electric light, metal lath, tile or terrazzo floors, plumbing.

Church and School (alts. and add.), Maple Shade, N. J. Architect taking bids due July 15th. Architect, Emil G. Perrot, 1211 Arch street, Philadelphia. Owners, Our Lady of Perpetual Help Church, Maple Shade, N. J. Brick, steel, 2 stories, 49x135 feet, slate roof, maple and pine, cement floors, metal lath, tile work, bond, ornamental iron work.

Trunk Sewer System, Camden County, N. J. Work contemplated. Owners, Camden County, care of Dr. Thomas B. Lee, member of Camden County Sewage Survey Commission, Haddonfield, N. J.

New Jersey Contracts Awarded

Armory, Newark, N. J. Contract awarded F. & C. Haerter, Union City, N. J., \$239,500. Plumbing, Schrinell Brothers, Newark, N. J., \$15,500. Heating, Newark Heating Co., Newark, N. J., \$19,800. Electric, K. W. Electric Co., Newark, N. J., \$9,470. Architects, Division of Architecture and Construction, Charles J. Leatham, Director, State House, Trenton, N. J. Owners, Department of Institutions and Agencies, William J. Ellis, Commissioner, State House, Trenton, N. J.

Armory, Woodbury, N. J. Contracts awarded. General, plumbing and heating awarded to J. T. Allen, Woodbury, N. J. Electric to R. McMahon, Newark, N. J. Architects, Division of Architecture and Construction, Charles J. Leatham, Director, State House, Trenton, N. J. Owners, Department of Institutions and Agencies, William J. Ellis, Commissioner, State House, Trenton, N. J. Brick, reinforced concrete, cut stone, steel, 1 story and basement, 107x67 feet, slate, built-up roof, linoleum floors, membrane waterproofing, ornamental iron, caulking, fire doors, tile, marble, metal lath.

Pathological Laboratory, Vineland, N. J. Contract awarded Delaware Form Co., 1001 Chestnut street, Philadelphia. Architects, Division of Architecture and Construction, Charles J. Leatham, Director, State House, Trenton, N. J. Owners, Department of Institutions and Agencies, William J. Ellis, Commissioner, State House, Trenton, N. J. Brick, concrete, steel, 1 story and basement, 28x43 feet, slate roof, cement floors, metal lath, bond, ornamental iron work.

Temporary Work Shop, Southwest Corner Haddon avenue and Old White Horse pike, Camden, N. J. Contract awarded Carl E. Wildell, Woodlyn, N. J. Architect, Joshua C. Jeffers, Camden, N. J. Owners, George D. Wetherill & Co., Inc., on premises. Frame, 1 story,

26x48 feet, corrugated iron roof, cement floors, electric light.

Residence, 923 Mechanic street, Camden, N. J. Contract awarded Barney Poduszazak, 1327 Morton street, Camden, N. J. Architect, private plans. Owner, Albert Kalkiewicz, 1192 Jackson street, Camden, N. J. Brick, 2 stories, 16x52 feet, slag roof, hot water heat.

Factory (fire repairs), Fifteenth and Pine streets, Camden, N. J. Contract awarded John J. Welsh, 529 Washington street, Camden, N. J. Owners, Wilkes, Martin & Wilkes Co., on premises. Rebuilding of third and fourth floors.

Road Work, New Jersey. Contracts awarded. Owners, State Highway Commission, A. Lee Grover, Chief Clerk, State House Annex, Trenton, N. J.

Bridges, Route 25, Sec. 8A, Rahway and Linden, Union County. W. J. Wilck, Perth Amboy, N. J., \$17,989.10.

Route 4, Sec. 5, from Paterson to Areola, Bergen County. Gerritsen Construction Company, Lodi, N. J., \$273,102.79.

Route 39, Sec. 4, 5 and 6, South Pemberton road to Oak Shade, Burlington County. Fabio Matazzo, 1287 Kaighn avenue, Camden, N. J., \$314,968.01.

Miscellaneous Construction News

Hospital for Colored, Jacksonville, Fla. Preliminary plans in progress. Will take bids in fall, 1929. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, The Brewster Hospital, Jacksonville, Fla. Brick.

School, Sykesville, Carroll County, Md. Owners will be ready for bids in ten days. Architect, B. E. Starr, 9 North Second street, Harrisburg, Pa. Owners, Board of Education, Westminster County, Md. S. Unger, Westminster, Md. Brick, steel, tile, 2 stories and basement, 60x105 feet, slag roof, wood deck, maple floors, safety treads, roof ventilators, cast stone, steel sash, bond.

Miscellaneous Contracts Awarded

Residence and Garage, Wilmington, Del. Contract awarded C. J. Dougherty, 600 Tannall street, Wilmington, Del. Architect, Albert Ely Ives, Delaware Trust Building, Wilmington, Del. Owner, Royal Hill, care of architect. Stone, 2½ stories, 160x40 feet, slate roof, hardwood floors, hot water heat, electric light, tile, marble.

Engineering Building, Newark, Del. Contract awarded J. B. Ferguson, Hagerstown, Md. Architect, Charles Z. Klauder, 1420 Walnut street, Philadelphia. Owners, University of Delaware, Dr. Hullihen, on premises.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

AS THE EDITOR SEES IT

THE semi-annual report of building operations in Philadelphia for the first six months of this year, published in detail on other pages of this issue of the GUIDE, shows a decrease of \$3,258,885 in total value of work of all kinds compared to the first six months of 1928.

The total estimated cost of all work for which building permits were issued by the Philadelphia Bureau of Building Inspection in the six months ending June 30, 1929 was \$59,485,200, compared to \$62,744,085 for the first six months of 1928. The number of operations declined 1889 for the corresponding periods. To June 30, 1929, permits were issued for 3,842 new buildings at an estimated cost of \$53,908,155; additions 808 at cost of \$2,666,765; alterations and repairs, 1,478 costing \$1,958,465; miscellaneous permits, 1,398, costing \$953,815.

The type of building showing the largest increase in cost was stores in which there was an increase from \$1,818,190 in first half year 1928 to \$11,133,500 in first half of 1929. There was a decrease in the number from 60 in 1928 to 45 in 1929. The \$10,000,000 store of Strawbridge & Clothier started in January caused the great increase in this type of building.

In office buildings there was an increase in estimated cost in 1929 to June 30 over first half of 1928, although a drop in the number of office buildings. In first six months of 1928 twenty-eight office buildings cost \$3,205,665; in 1929 twenty-one office buildings cost \$6,644,545. Warehouses in the periods under comparison showed a notable increase in value although the same number were started in both 1928 and 1929. In 1928 50 warehouses cost \$2,423,015, in 1929 the same quantity cost \$6,301,540. In only two other types of buildings, Churches and power houses, was there any increase in estimated cost of 1929 over 1928 to June 30.

The greatest decrease is noticeable in residences of the two-story type; in the first half of 1928, 4683 houses cost \$19,638,500; in first six months of 1929, 2,915 houses cost \$12,192,635, a decline of 1,768 and a drop in cost of \$7,445,864.

Garages likewise show a decline from 761 costing \$1,738,230 to 556 costing \$1,129,870. Schools show a drop in estimated cost from \$3,267,190 in 1928 first half year to \$2,861,190 for same period in 1929; the same number of schools, 12, were started in corresponding periods.

Bureau of Building Inspection records show the following first-half totals for the ten years preceding 1929:

1919, \$21,982,990; 1920, \$38,538,245; 1921, \$16,617,010; 1922, \$52,429,145; 1923, \$75,217,095; 1924, \$72,573,485; 1925, \$86,014,515; 1926, \$70,199,500;

1927, \$61,511,490, and 1928, \$62,744,085.

Two-story house aggregates during the first six months of these years were: 2384, in 1919; 827, in 1920; 535, in 1921; 4744, in 1922; 4892, in 1923; 5487, in 1924; 7730, in 1925; 4965, in 1926; 4888, in 1927, and 4683, in 1928.

January with \$17,161,370 estimated value of work started is the largest month in 1929. June with \$10,916,385 was next in volume of work started. March, with 1728 operations, of which 959 were houses of the two-story type, showed greatest activity.

The record for the first six months of 1928:

Month	Permits	Operations	Estimated Cost
Jan.	557	741	\$ 4,482,600
Feb.	615	1,266	9,157,835
March	900	2,072	10,657,745
April	900	1,550	9,161,970
May	998	1,737	13,583,485
June	890	2,049	15,700,450

The record for the corresponding six months of 1929:

Month	Permits	Operations	Estimated Cost
Jan.	543	869	\$17,161,370
Feb.	556	748	5,024,620
March	832	1,728	10,160,135
April	987	1,727	7,329,520
May	926	1,264	8,893,170
June	804	1,190	10,196,385

In two story dwellings the Forty-Second Ward shows the largest number, 1060, started in first half of 1929, although 300 less than same period 1928. The Thirty-fifth Ward with 631 two story houses was second in number, but likewise showed a drop from 1428 in 1928 to 631 in first half of 1929. In no wards were there increases over the first half of 1928.

Substantial losses have occurred in many territories through the country but there is still a great volume of work in prospect and any reason for uneasiness in the building industry.

Now that Insulating Plaster Base is being used so extensively and material dealers are finding an increasing demand for such lines as Insulating Boards and Insulating Lath, I believe that giving a little history of our experience in pioneering and successfully building up a large business on these items, may be of interest to my many friends.

We purchased our first car of Insulating Board some six years ago, and as is usual, we went ahead on our regular lines, thinking it would sell itself and without effort on our part, when we did begin to realize that this wasn't the case, we put forth every effort to unload, regardless of where and how it was to be

used, and with the result that we had a number of complaints.

We carefully investigated every complaint, and were then convinced that here was a new material with wonderful possibilities, not only for the dealer, but the consumer, if ordinary horse-sense was practiced in its sale and use.

Looking back and analyzing the complaints we had, the following are but a few of the contributory causes:

1. Panels nailed cross-wise of studs, without headers, instead of length-wise.
2. Panels not properly centered on studs, nor nailed as directed.
3. Panels were forced into place, not having clearance for expansion.
4. Studs were not true nor properly spaced, and of green stock, which warped and pulled away from panels.
5. Studs and joists were 24-inch centered, instead of 16-inch centered, as directed.
6. Panels expanded after first coat of plaster was applied causing buckling, cracks and unevenness.
7. Difficulty was experienced in some cases, due to the plasterers skimping on amount of material used.

The carpenters and plasterers soon became just as anxious to attain good results as were we, and cooperated in seeing that the manufacturer's instructions were fully carried out, however, we still had occasional complaints, where the material was plastered on, that in some cases it would expand to such an extent as to buckle and crack the first coat of plaster.

These complaints would come up where the board used was part of the same car from which other jobs we had furnished, were perfect, and in checking this, we could only arrive at the following conclusion:

Insulating Boards and Lath are shipped from the mill bone-dry and stacked in piles as they emerge from the dry kiln, and it takes considerable time for these panels to adjust themselves and take on the prevalent air moisture content. We found most of these complaints we had were where delivery to the job was made from stock just received from the mill, and that these panels if immediately nailed and exposed on both sides as they were, took up the moisture content very quickly and naturally, this caused an expansion, the only outlet being to buckle between the studs.

We also found where fresh stock was so used as a plaster base, that the rapid absorption of moisture from the plaster was detrimental, and also caused a violent expansion of the boards.

It wasn't feasible for us to stock such materials until they were acclimated to

prevalent moisture conditions in our territory, and we also could see where it was impossible for the manufacturer to ascertain in advance of his shipments, what conditions would be in such and such a territory, and at the time the boards would be used, and thereby adjust the moisture content of the boards to such a situation.

Knowing that it has always been good practice to wet kiln dried Wood Lath and shingles before using, I tried out the same plan on Insulating Boards and Lath. I made arrangements in my yard and saw to it that on each order, every panel of Insulating Board and Lath was well sprinkled and then repiled, at least thirty-six hours before they were delivered to the job and used. In doing this, I knew that each panel would expand to the maximum and that only one thing could result—a slow contraction and not to a noticeable extent, and in the Lath, the contraction would not take place until the plaster had set, and this slight readjustment would be taken up by the resiliency of the Lath.

We followed this plan, and with such success that our customers are now sold on the idea and advantages of Insulating Boards and Lath, and we are now selling several cars each month, with universal satisfaction, whereas our first car lasted nearly a year and caused lots of grief.

We realize that when something happens, a blame must be placed somewhere and invariable, the responsibility is placed on whatever new material is used—never on the human element involved, however, we have faith in the justification of selling and using Insulating Boards and Lath, and if our experience in promoting their successful use is of value, we are glad to pass it on.—*Exchange*.

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—*John D. Rockefeller*.

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

This School Guaranteed Dry for FIVE YEARS

A carload of "ANTI-HYDRO" (3300 gallons) was used to waterproof the foundations, walls, floors and swimming pool through the mass of concrete of this Two-and-a-Half Million Dollar school building.

A cheap substitute for "ANTI-HYDRO" had been approved by the architect and could have been bought for one-half the cost of "ANTI-HYDRO." This substitution would have meant a considerable saving for the contractor.

But—

The contractor insisted on a guarantee of a waterproof job which the manufacturer of the cheap substitute refused to give.

"ANTI-HYDRO" was then used and the job was guaranteed to remain watertight for FIVE YEARS.

"ANTI-HYDRO" is easy to use and saves time, labor and repair costs. It is a liquid integral compound which mixes readily with water without the aid of skilled labor. For 25 years it has been the accepted BEST. Use "ANTI-HYDRO" on your next water-proof job for guaranteed results.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Lukens, on premises. Cinder block, stucco, 2½ stories and basement, 22x24 feet, slate roof, oak and pine floors, plumbing, screens, hot water heat, electric light, metal lath, tile work.

Residence (alts. and add.), 411 State road, Cynwyd, Pa. Contract awarded W. O.

Springer, 2004 Naudain street, Philadelphia. Architects, Savery & Scheetz, Stephen Girard Building, Philadelphia. Owner, Colonel Erskine Bains, on premises. Plastering, carpentry and mill work, painting, glazing, linotile floors, hot water heating, electric work, metal lath, tile work.

Residence and Garage, Jenkintown, Pa. Contract awarded W. D. Lukens, North Wales, Pa. Architects, Wigham & Cochrane, care of builders. Owner, John Smith, care of builders. Stone, steel, 2½ stories and basement, 30x80 feet, slate roof, oak and pine floors, hot water heat, electric light, metal lath, tile work, bond, ornamental iron work, casement windows.

Residence and Garage, Elkins Park, Pa. Contract awarded Robert S. Feeney and John Dallas, Elkins Park, Pa. Architect, Andrew C. Borzner, 717 Walnut street, Philadelphia. Owner, Edward Reukauf, Jr., 5026 Mervine street, Philadelphia. Stone block and stucco, 2½ stories, 30x50 feet, shingle roof, hardwood floors, hot water heat, electric light, tile work.

Residence and Garage, Elkins Park, Pa. Contract awarded Robert S. Feeney and John Dallas, Elkins Park, Pa. Plans in progress. Architect, Andrew C. Borzner, 717 Walnut street, Philadelphia. Owner, name withheld. Stone block, stucco, 2½ stories, 30x70 feet, shingle roof, hardwood floors, hot water heat, electric light, tile work.

Church, Highland Park, Pa. Contract awarded N. W. Bryan, 10 South Eighteenth street, Philadelphia. Architects, Furness & Evans Co., 313 South Fifteenth street, Philadelphia. Owners, Protestant Episcopal Church of the Holy Sacrament, Rev. George W. Barnes, West Chester pike and Park avenue, Highland Park, Pa. Stone, fireproof, steel, reinforced concrete, 1 story, 50x90 feet, slate or tile roof, vapor heat, electric light.

Residence (alts.), Church road, near Sunnybrook Farm Railroad Station, Montgomery County, Pa. Contract awarded J. W. Moffley, 3rd, Germantown and Bethlehem pike, Philadelphia. Architects, Willing, Sims & Talbutt, 126 South Eighteenth street, Philadelphia. Owner, Edward N. Benson, 1428 Walnut street, Philadelphia. (Plumbing, heating, electric reserved), shingle roof, oak and pine floors, plastering, stone work, carpentry and mill work, painting, glazing, iron work, metal lath, tile work.

Residence and Garage (alts. and add.), Skippack pike, near Blue Bell, Pa. Contract awarded John W. Moffley, 3rd, Germantown avenue and Bethlehem pike, Philadelphia. Architects, Willing, Sims & Talbutt, 126 South Eighteenth street, Philadelphia. Owner, Cooper Howell, on premises. Stone, limestone, steel, 2½ stories and basement, 47x20 feet, shingle roof, oak and pine floors, cement floors, waterproofing, flagstone, metal lath, tile and marble work, ornamental iron work, area gratings.

Consolidated School, Green Lane-Marlborough, Pa. Contracts awarded. Architect, W. Marshall Hughes, 147 North Fifth street, Reading, Pa. Owners, Joint School Board of Green Lane and Marlborough Townships, A. H. Van Fossen, Secretary, Green Lane, Pa. Brick, cast stone, steel, 1 story and basement, 120x54 feet, slag roof, maple floors, metal lath, bond, ornamental iron work. General: W. L. Van Fossen, Green Lane, Pa., \$19,250. Heating, American Heating & Ventilating Co., 1505 Race street, Philadelphia, \$4,290. Plumbing, Warren Smith, Boyertown, Pa., \$970. Electric, not yet awarded.

School (add.), \$3,871. Hood road, near Sharon avenue, Sharon Hill, Pa. Contract awarded Taggart & Thompson, 2814 North Broad street, Philadelphia. Architect, Mahlon

J. Bye, Summit avenue, Primos, Pa. Owners, Darby Township School Board, H. A. Fisher, Secretary, Darby Township, Pa. Brick, steel, second story add., 20x30 feet, 2 wings, slag roof, metal lath, plumbing, maple and pine floors, roof ventilators, ornamental iron work, cinder concrete block.

Road Work, Pennsylvania. Contracts awarded. Owners, Pennsylvania Department of Highways, James L. Stuart, Secretary, Harrisburg, Pa.

Jefferson County, R-61, Pine Creek Township, Brookville Borough. One course reinforced concrete. Milliron Construction Co., Dubois, Pa., \$55,807.53.

Indiana County, R-319, Sec. 2, Sec. R-1, Armstrong Township, Shelocta Borough. One course reinforced concrete. Farris Engineering Co., Pittsburgh, Pa., \$49,283.45.

Bucks County, R-386, Springfield and Durham Townships. Grading and drainage. H. S. Shafer, Nazareth, Pa., \$35,746.46.

Lehigh County, R-443, Sec. 3, Weisenberg Township. One course reinforced concrete. Continental Contracting Co., Knickerbocker Building, Baltimore, Md., \$178,084.

Blair County, R-53, S-R2, Allegheny and Juniata Townships. One course reinforced concrete. Clark Brothers Construction Co., Cherrytree, Pa., \$288,060.94.

Bradford County, A-5800, Springfield and Durham Townships. Grading and drainage. N. D. Richardson Construction Co., Scranton, Pa., \$19,900.75.

Lawrence County, R-693, Sec. 1, Wilmington and Pulaski Townships. One course reinforced concrete. J. D. Devine Co., Meadville, Pa., \$169,920.55.

Erie County, R-351, Waterford Township, Summit Township. One course reinforced concrete, grading and drainage. Lewis-Copeland Construction Co., Lima, Ohio, \$137,659.18.

Lancaster and Chester Counties, R-215, 142, R-142, West Sadsbury and Sadsbury Townships. One course reinforced concrete (dual type), one course reinforced concrete. W. Grant Raub Co., Red Lion, Pa., \$328,820.14.

Residence, Marshall street, West Chester, Pa. Contract awarded McCormick Bros., 17 North Walnut street, West Chester, Pa. Architect, W. J. Corcoran, West Chester, Pa. Owner, Mrs. P. D. Maule, West Chester, Pa. Hollow tile, stucco, 2½ stories, 28x38 feet, asbestos shingle roof, hardwood floors, hot water heat, electric light, tile work.

Gardener's Cottage (alt. and add.), Ardmore, Pa. Contract awarded Metzger & Co., Otis Building, Philadelphia. Architect, Horace Trumbauer, Land Title Building, Philadelphia. Owners, A. Atwater Kent, care Atwater Kent Mfg. Co., Wissahickon and Abbot'sford roads, Philadelphia. Hollow tile, stucco, 1½ stories and basement, 20x31 feet; 2½ stories and basement, 30x36 feet, slate roof, oak and pine floors, hot water heat, electric light, tile work, bond, ornamental iron work.

GRADE-MARKING AS THE PRODUCER SEES IT

(Address by J. F. CARTER, Trade Promotion Manager, Southern Pine Association at Convention of National Association of Purchasing Agents at Buffalo, N. Y., June 3, 1929)

The practice of marking lumber so that the buyer might be at all times protected has been in vogue in the European countries for more than one hundred years.

It is not possible to obtain exact information as to any opposition which certain factors in the lumber business may have placed against the grade-marking of lumber more than a century ago, but there has been in these United States of America during the past five years a very determined opposition to the practice of the official marking of grades upon lumber, though it must not go without saying that many endorsements, even by those who oppose the practice, have been given to the principle of grade-marking.

The grade-marking of lumber is nothing more nor less than the stamping upon the end of the stick an insignia which explains to the buyer the grade into which each stick falls. A mere trade-mark of a lumber manufacturer is not sufficient,

as it affords no assurance to the buyer that he is getting the grade he is paying for.

In speaking to you today, believing that you have already been acquainted with the methods used in grade-marking, it shall be my endeavor to place before you for your consideration the answers to as many of the objections as have come to my attention.

The purchasing agent is either the customer of a retailer of lumber or of the sawmill through a middle man. Very few purchasing agents know the grades of lumber. Very few of them know the qualities of lumber. Grade and quality are not the same. The two words mean different things. Do not be confused. It is a wonderfully easy thing for one of persuasive tongue to so handle English words as to confound and confuse.

Lumber cannot be analyzed. It is not a homogeneous mass which has been put together by any formula of man. It is a product of the tree which suffers or enjoys climatic conditions, sunlight, and the competition for these things with its competitor trees. No experienced mill can saw a tree into what he wishes as to quality or grade. Rather must he be wise enough in the vast lore of sawmill experience to so cut the log that those things are produced which will enjoy particular characteristics.

There are many two-by-fours produced from trees which should not have been cut for twenty years more, and there are many two-by-fours produced which should have been cut into boards. But not by the experienced sawmill man. To him, that would be a breach of the training which years of honorable manufacturing have given to him.

Since lumber is not a homogeneous mass, since it cannot be analyzed, since percentage of summerwood, closeness of grain, angle of grain to the edge, size of knots and placement of knots, checks and cracks and waney edges, as well as mis-manufacture through the machines all have their direct bearing on the grade into which a piece of lumber shall be classed, it becomes necessary to have expert men divide lumber into the various grades which have been established. Not all men who have spent years about a sawmill can be graders. There is a knack to grading which not everyone can easily acquire.

Do you realize that the official grade rules of lumber associations allow a five percent. leeway to compensate for the difference in the opinions of grading experts?

If expert graders are admittedly as far apart as five percent. from each other, is it not reasonable to expect that those who do not know lumber can be easily fooled?

When a purchasing agent sends out his

inquiry on a bill of lumber he mentions the length, breadth and thickness, whether rough or dressed, and names the grade. It may be the grade which is suitable, and it may not. But the purchasing agent names the grade. When this inquiry reaches the sawmill a quotation is made on the grade which has been named. Somewhere between the lumber manufacturer and the purchasing agent there is often a man who realizes that the purchasing agent either has not chosen the proper grade, or does not have a means for inspecting grades. Thus it is easily possible for the middle man to quote slightly lower than for the proper grade, but higher than for the next lower grade, making a better profit thereby and assuring himself the order.

That is called substitution of grades. It is not an uncommon practice. There are scores of cases which have been seen by myself and by others with whom I work. Requirement of the grade-mark by the purchasing agent will check this substitution of grades if only the purchasing agent will refuse to accept anything else.

A very strong point has been made, and continues to be made, that grade-marked lumber will cost more than lumber which is not grade-marked. The lumber manufacturer replies to that statement in two ways. One is to say that you do not pay any additional price because lumber is grade-marked. If it happens that the lumber for which you pay a higher price is grade-marked, the higher price is caused by better quality of the lumber, and if it were not grade-marked you would have to pay the same additional price. We lay stress on the confusion which is caused by the use of the word "grade" instead of the word "quality."

The second answer the manufacturer makes is this: There is a very strong probability that many who buy lumber can actually save money by requiring that it be grade-marked. In order that you may understand this statement and interpret it correctly, permit me to illustrate:

There are furniture manufacturers

whose purchasing agents are buying No. 2 Common Southern Pine for crating. They are buying through certain middlemen because they enjoy lower quotations from such particular middlemen. Now, it must not be expected that such middlemen can make a profit and yet quote a lower price than the producer. So, there must exist a difference in the grade. If such furniture manufacturers will require and purchase the next lower grade-marked, they will get a lower price and will get the same grade they are now getting. The point to this is that they are paying too much for the lumber they are buying. Since the next lower grade is really the one they are getting, and it is satisfactory, why pay so much for it just because they are fooled into thinking they are getting a higher grade? Why not buy that lower grade, require that it be grade-marked, and pay less money? Think it over. Learn what grade you are getting, purely aside from what you think you are getting and ascertain whether it is satisfactory. If satisfactory, and if of a lower grade than you have thought you were getting, just require that lower grade, and that it be grade-marked. Your employer will appreciate your ability.

About a year ago we called on purchasing agents in the anthracite field of eastern Pennsylvania to learn they were buying on price. The engineers asked for a particular grade; the purchasing agents issued inquiries for that grade; from one group of men came bids as low as \$46.00 per thousand feet while from mills in the South came bids on the same inquiry as high as \$78.00. The purchasing agents thought it queer, but bought at the lower price—and we found he was getting the third grade below the one he had ordered. Isn't it rather peculiar that a sawmill man will make a price of \$78.00 on an inquiry and the same sawmill supply some wholesaler or retailer so that he can sell for \$46.00? Yet that is what was happening. The purchasing agent thought the sawmills would not sell them direct. That was not the trouble at all. The trouble was very clearly this, as definitely proven in

several instances—that the middleman was ordering from a sawmill the third grade lower, and delivering it to the purchasing agent's industry.

We explained these facts to the engineers and purchasing agents. Higher price? Of course they had to pay a higher price for a higher grade—no low grade item of any sort sells for as high a price as the high grade of that item, whether it be lumber or cabbages. Did the engineers actually need the higher grade for which they were asking? They did. Those engineers knew what they wished, and were vainly trying to get it. But the purchasing departments were buying on price, which forestalled the engineers from getting the thing desired.

What is this difference between \$46.00 and \$78.00 which was asked for two vastly different grades? It was a premium on an insurance policy. That is what grade-marking means to you as purchasing agents—it is an insurance policy. In the case of the anthracite purchasing agents it is an insurance policy against the losses of lives and limbs of workmen and the losses of production caused by failures of poor quality timber as mine shaft guides and in breaker houses. It is an insurance policy covering replacements and the loss of time in repairs. The premium is small, for it is not an annual payment—it is a one-time premium covering a period of perhaps twenty-five years. May I ask if the purchasing agents in the anthracite field are better purchasing agents for their employers when they are demanding the right grades, plainly marked on the timbers and paying higher prices for the right grades? Not one of them is a spendthrift. They are thoughtful buyers. They know they are making money for their employers by such discreet buying. Their positions are more secure—they are better able to justify their work.

Grade-marking of lumber is an insurance policy for the lumber buyer who needs only the material for crates. Out in the furniture manufacturing section of Michigan there is much crate material

used. Most of those purchasing agents are ordering No. 2 Common Southern Yellow Pine, buying their requirements entirely on a price basis. Are they getting No. 2 Common by this method? We think they are not. I have seen stacks of that crate material of a No. 3 Common grade. But, please notice this: the No. 3 Common grade serves the purpose. Why do not these buyers purchase No. 3 Common and require that it be grade-marked? They would get a lower price than they get today, since grade-marked No. 3 Common brings a lower price than the material they now buy. They could save money for their employers by requiring that the grade be No. 3 and that it be so grade-marked. On the other hand, if the grade they now get is not satisfactory, they should actually get a No. 2 Common grade by requiring that it be grade-marked. They are either losing cash money or they are getting a grade that is too low, which is the exact equivalent. Grade-marking is an insurance policy for them. They should require it.

When a sawmill in the South becomes a subscriber to the services of the Southern Pine Association an official inspector calls at that mill to check the graders of lumber. Not infrequently the grades are from 15 to 18 percent. below perfect. That is not permissible in the Southern Pine Association. The rules of that Association are that a mill must not show a deviation of more than five percent., this to cover the differences in men's opinion of grades. Shortly after such mill becomes a subscriber to the Southern Pine Association the official inspector finds the grading is far better, and in that short while the mill grade climbs from 85 percent. to the required 95 percent., and better. That is what policing does. That is what we mean when we say that grade-marking preserves the integrity of the grades. The wholesaler or retailer of lumber, or anyone else who attempts to befog the issue by saying grades are just as good when coming from non-Association mills as from Association mills, are flying squarely into the face of the official mill inspection reports stretching back over a long period of years. Those official inspections are a matter of record in our office at New Orleans, and reports may be obtained by the use of a two-cent stamp.

Any association of lumber manufacturers which operates an efficient inspection department is easily able to answer whether as good grades are obtained in a shipment from non-grade-marking mills as from grade-marking mills. Let me quote figures from the inspection department of the Southern Pine Association covering the first four months of 1929, this report having to do only with claims against shippers of lumber because their lumber was off-grade. It is shown quite

clearly that subscriber mills to the Southern Pine Association in 156 claim inspections were 9.6 per cent. below grade, while 177 claim inspections for mills which are not subscribers to the Southern Pine Association showed 21.86 percent. below grade. This great difference between 9.6 percent. and 21.86 percent is the reason why purchasing agents should require the grade-mark.

One particular instance of lumber being tremendously off-grade, even though it was grade-marked, may be mentioned by some one to you today. We are cognizant of all the facts and are prepared to place the facts before you in the event that case be mentioned as an argument against grade-making. I have brought along a full report on that transaction. It is a mill in Mississippi and the case is one of the most glaring attempts on the part of a lumber-selling force to discredit grade-marking and at the same time is one of the most glaring illustrations of the practice of substitution of grades. It is a case which should be placed in the hands of the purchasing agent who is permitting one of the most violent substitutions of lumber grades to take place. It is hurtful both to purchasing agents and to himself. It has to do with a railroad purchasing agent and a direct substitution of No. 2 Common and No. 3 Common Decking to fill an order for No. 1 Common, purchased on price alone, and is not a secret. There are a dozen shipping clerks and sales managers in the South who know the facts about substitution to the particular railroad.

It has been said that a large buyer of lumber is not so much interested in grade-marking because he has a qualified inspector, the expense being justified by the volume of his buying and he feels competent to protect his own interests. I daresay we shall all agree that the purchasing agent who handles but little lumber should be protected, and that the grade-mark is the protection. But let us refer to the statement about the large buyer.

In order that this statement be properly met, in order that the large lumber purchasing agent be acquainted with the need of the grade-mark for his protection, permit me to revert to our statistics as regards grading at the mills.

Our records show, as I have remarked, that when a mill subscribes to our Southern Pine Association a special inspection report is made on the grading by that mill's lumber graders. Before the mill becomes affiliated with the Association and has its grading checked and policed by Association inspectors, we find it as far as 15 per cent. below grade. After checking by Association inspectors we find the grading is up to the required 95 percent., and even better. Is it to be expected by your large lumber purchaser that his in-

spector will be any better than, or nearly so good as, the inspector at the mills? Yet, when not being checked by trained Association inspectors, this mill inspector is as far as 15 percent. off-grade. It appears the large lumber buyer needs the grade-mark.

Today when you are buying one species of lumber the grade-mark means more than merely the natural defects which occur in wood. The Southern Pine Association, after two years of considerate study of the subject of moisture content, has written into its grade rules such specific provisions covering moisture content that the grade-mark is now a guaranty of the amount of water in the lumber you buy.

The difference in strength between green lumber and dry lumber is as one is to two, meaning that dry lumber is almost twice as strong as green lumber. Whether you are buying lumber for use in a residence, a warehouse, for use about a manufacturing plant or for crating material, the dryness of the lumber is an important factor as to strength, nail holding ability, ability to hold screws, and continuance of the wood to stay in the same place. Quite true, only one species of lumber, Southern Yellow Pine, is today guaranteeing a moisture content under its grade rules, and is the only one in which the grade-mark gives you a guaranty of the amount of moisture present. This is an indication to you of the value of the grade-mark. It is worth your serious consideration.

Lumber is a highly competitive material. There are thousands of sawmills of all sizes. Some of them produce high quality lumber, some very poor quality and some are in the great middle class, too good to be poor and too poor to be good. Grade-marking as a practice on the part of the better mills cannot raise the price within itself. It is a poor observer of economies who will accuse the lumber manufacturers of any such motive. But, as a general rule, and one which can quite readily be recognized, the grade-marking mill gets a better price for its lumber because it produces better lumber, takes more care in the manufacture, chooses the trees to be cut and the kind of cuttings which shall be made, invests money to carry heavy stocks to meet the customer's requirements, dries its lumber more carefully, and loads it in clean cars, using every means for the protection of its lumber from the mill to the retail yard or the industrial user.

(Continued Next Week)

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

This School Guaranteed Dry for FIVE YEARS

A carload of "ANTI-HYDRO" (3300 gallons) was used to waterproof the foundations, walls, floors and swimming pool through the mass of concrete of this Two-and-a-Half Million Dollar school building.

A cheap substitute for "ANTI-HYDRO" had been approved by the architect and could have been bought for one-half the cost of "ANTI-HYDRO." This substitution would have meant a considerable saving for the contractor.

But—

The contractor insisted on a guarantee of a waterproof job which the manufacturer of the cheap substitute refused to give.

"ANTI-HYDRO" was then used and the job was guaranteed to remain watertight for FIVE Years.

"ANTI-HYDRO" is easy to use and saves time, labor and repair costs. It is a liquid integral compound which mixes readily with water without the aid of skilled labor. For 25 years it has been the accepted BEST. Use "ANTI-HYDRO" on your next water-proof job for guaranteed results.

Solis Cohen, Elkins Park, Pa. Cement floors, electric work, linoleum floors, sheet metal work, metal lath, plastering.

Residence, Rydal, Pa. Contract awarded Roy Randall, Jenkintown, Pa. Architects, Wigham & Cochrane, care of owner. Owner, Wayne Herkness, Packard Building, Philadelphia. Stone, steel, 2½ stories and basement, irregular in size, slate roof, oak and pine floors, hot water heat, electric light, metal lath, tile work, bond, ornamental iron work.

Residence, Speeceville, Pa. Contract awarded H. B. Alexander, Paxtang, Pa. Architects, Minich & Jamison, 23 North Third street, Harrisburg, Pa. Owner, J. F. Bowers, 321 Hummel street, Harrisburg, Pa. Stone, 2½ stories, 45x30 feet, slate roof, hardwood floors, vapor heat, electric light, tile work.

Residence, North Second street, Harrisburg, Pa. Contract awarded C. W. Strayer, State street, Harrisburg, Pa. Architect, B. E. Starr, 9 North Second street, Harrisburg, Pa. Owner, Ira Kindler, 25 South Nineteenth street, Harrisburg, Pa. Brick, 2½ stories, 38x28 feet, slate roof, hardwood floors, steam heat, electric light, tile work.

Residence and Garage, Shippensburg, Pa. Contract awarded W. A. Zern, Shippensburg, Pa. Architect, H. R. Lenker, 25 North Duke street, York, Pa. Owner, C. Naugle, 13 Mor-

ris street, Shippensburg, Pa. Stone, 2½ stories, 61x30 feet, slate and tile roof, hardwood and concrete floors, vapor heat, oil burner, electric work, tile, marble, flagstone, cast stone.

Sunday School (add.), Waynesboro, Pa. Contract awarded A. J. Etter, 223 South Potomac avenue, Waynesboro, Pa. Architect, J. A. Dempwolf, Cassatt Building, York, Pa. Owners, Lutheran Church of Waynesboro, Rev. Dr. Travis, Waynesboro, Pa. Brick, stone, 2 stories and basement, 80x150 feet, slag roof, wood floors, electric light, tile work, brownstone.

Bank, Scranton, Pa. Contract awarded Industrial Construction Co., Union Bank Building, Scranton, Pa. Architect, D. H. Morgan, Union Bank Building, Scranton, Pa. Owners, East Scranton State Bank, care of E. H. Hausser, 1417 Ash street, Scranton, Pa. Limestone, steel, 22 feet high, 35x60 feet, slag roof, marble floors, electric work, tile, marble, casement windows, bronze.

Residence, Harrisburg, Pa. Contract awarded H. B. Alexander, Paxtang, Pa. Architect, C. J. Lappley, Parkside Building, Harrisburg, Pa. Owner, F. S. Fornwald, care of architect. Brick, 2½ stories, 30x35 feet, shingle roof, hardwood, concrete and tile floors, hot water heat, electric light, tile, flagstone.

Hospital Wing, West Chester, Pa. Contract awarded William M. Francis Co., DuPont Building, Wilmington, Del. Architect, E. William Martin, DuPont Building, Wilmington, Del. Owners, Chester County Hospital, care of architect. Steel, stucco, brick, 3 stories and basement, 35x140 feet, tile roof, concrete and terrazzo floors, hollow tile, heating extension, tile, marble, metal lath, electric light.

Residence and Garage, Tennis avenue, Ambler, Pa. Contract awarded W. D. Lukens, North Wales, Pa. Architect, F. Trout, care of Horace W. Castor, Stephen Girard Building, Philadelphia. Owner, H. R. Sulzer, care of Sulzer Co., 252 North Eleventh street, Philadelphia. Stone, 2½ stories, 37x31 feet, slate roof, hardwood floors, tile work, electric light, moist warm air heat.

Residence, Pottstown, Pa. Contract awarded William A. Griffith, 53 Chestnut street, Pottstown, Pa. Architects, Muhlenberg Brothers, 113A South Fourth street, Reading, Pa. Owner, Dr. C. W. Hancox, Strand Theatre Building, Pottstown, Pa. Brick, stone, 2½ stories, 15x14 feet, 37x24 feet, 12x12 feet, slate roof, hardwood floors, electric light, tile work.

New Power Plant Building, Schuylkill Haven, Pa. Contracts awarded. Engineer, Albert C. Wood, Stock Exchange Building, Philadelphia. Owners, Borough of Schuylkill Haven, J. A. Hermer, Schuylkill Haven, Pa. Brick, steel, concrete, 1 and 2 stories and basement, 102x38 feet, wing 48x63 feet. Item No. 1, to Gorodon Nagle, Pottsville, Pa. Item No. 2, to Reading Chain & Block Corporation, 2401 Chestnut street, Philadelphia. Item No. 3, to Atlas Chalmers Manufacturing Co., Atlantic Building, Philadelphia. Item No. 4, to C. H. Wheeler Manufacturing Co., Eighteenth and Lehigh avenue, Philadelphia. Item No. 5, to General Elec. Co., Witherspoon Building, Philadelphia. Item No. 6, to be done by Borough of Schuylkill Haven. Item No. 7, to Specially Engineering Co., Trenton and Allegheny avenues, Philadelphia. Item No. 8, to General Elec. Co., Witherspoon Building, Philadelphia.

Bridge, East Ninth street, Chester, over Ridley Creek, Pa. Contract awarded Carl R. Camp, 10 South Eighteenth street, Philadelphia, \$85,400. Engineer, George Wright, Delaware County, Media, Pa. Owners, Delaware County Commissioners, G. T. Wades, Media, Pa. Reinforced concrete, granite facing, 2-

foot ballastard on either side, 2 60-foot approaches, steel fencing.

Road Work, Pennsylvania. Contracts awarded. Owners, Pennsylvania Department of Highways, James L. Stuart, Secretary, Harrisburg, Pa.

Clinton County, A-5551, Chapman Township. Bituminous surface treated macadam surface course; grading and drainage. Charles B. Elder, Renova, Pa., \$34,257.06.

Clearfield County, R-234-7, Decatur Township. One course reinforced concrete. David Bailey, Morrisdale, Pa., \$42,431.

Clarion-Forest Counties, R-380, Farmington and Jenks Townships. Grading and drainage. H. S. Hull, Smethport, Pa., \$42,927.25.

Luzerne County, R-5, Sec. 2, Bridge, Dupont and Avoca Boroughs, over tracks of Delaware & Hudson and Lehigh Railroads. Anthracite Bridge Co., Scranton, Pa., \$173,884.03.

Warren County, R-89, A-5547, Eldred, Deerfield and Pittsfield Townships. One course reinforced concrete, grading and drainage. Kirkpatrick-Wallis Co., Johnsonburg, Pa., \$117,516.24.

Delaware County, R-133, Upper Darby Township, Milbourne Borough. One course reinforced concrete. F. Gillespie, Clifton Heights, Pa., \$27,727.73.

Snyder County, R-28, Beavertown Borough. One course reinforced concrete. J. M. Hutchinson & Narehood Brothers, Altoona, Pa., \$53,194.52.

Allegheny County, R-76, Sec. 4, Corapolis Borough, Robinson, Kennedy and Moon Townships. E. H. Canon, Pittsburgh, Pa., \$275,973.29.

New Jersey Construction News

Apartment, Pennlyn Place, Ocean City, N. J. Architect taking sub-bids. Architect, Ralph Emmerson Fields, 1025 Cherry Street, Philadelphia. Owner's name withheld. Frame, two stories, steam heat, tile work, asphalt shingle roof, hardwood floors.

Municipal Hall, Williamstown, N. J., \$250,000. Work contemplated. Owners, Monroe Township Commissioners, Elmer Mathews, Secretary, care of Williamstown Fire Company, Williamstown, N. J.

Sunday School and Fellowship Building (add.), Hightstown, N. J. Architect taking bids, due July 30th before 5 P. M. Architect, Norman Hulme, 1524 Chestnut Street, Philadelphia. Owners, First Presbyterian Church, Rev. Tyack, Hightstown, N. J. Frame, two stories, 40x80 feet.

Hotel, Beach Front, Avalon, N. J. Work contemplated. Owners, Company, care of Wm. C. H. Joiner, Avalon, N. J., and Mayor G. Bergner, Avalon, N. J. Brick, steel, concrete, 60 rooms.

School Building, Strawbridge Avenue, Haddon Township. Work contemplated. Owners, Board of Education, Haddon Township, N. J.

Fetter School, 3rd Street, between Walnut and Mt. Vernon Streets, Camden, N. J. Owners taking bids, due July 29th 2 P. M., D. S. T. Architect, Walter Thomas Mayo, 404 Temple Building, Camden, N. J. Owners, Board of Education, A. Austeruhl, 121 South 27th Street, Camden, N. J. Brick, reinforced concrete, one story, 60x80 feet.

Catto School, 30th and Morris Streets, Camden, N. J. Owners taking bids, due July 29th 2 P. M., D. S. T. Architect, Walter Thomas Mayo, 404 Temple Building, Camden, N. J. Owners, Board of Education, A. Austeruhl, 121 South 27th Street, Camden, N. J.

Brick, fireproof, one story, 60x105 feet, pine and cement floors.

Stadium, \$1,000,000, Merion Section, Jersey City, N. J. Site selected. Work contemplated. Owners, Jersey City Commissioners, Jersey City, N. J. Seating capacity 75,000 people.

Church and Sunday School, Irvington, N. J. Preliminary plans in progress. Architect, Norman Hulme, 1524 Chestnut street, Philadelphia. Owners, Irvington Methodist Episcopal Church, Rev. Roland L. Lourich, 64 Myrtle avenue, Irvington, N. J.

Residence and Garage, Atlantic and Rumson avenues, Ventnor, N. J. Sketches being prepared. Architect, Charles Schaefer, 11 South Sixteenth street, Philadelphia. Owner, W. A. Brady, Overbrook Arms, Sixty-third and Lebanon avenue, Philadelphia. Details undecided.

Sunday School (alts. and add.), Woodbury, N. J. Architect selected. Too early for details. Architect, Office of John B. Thomson, 1321 Arch street, Philadelphia. Consultant, Henry E. Tralle, Hudson View Garden, Pinehurst avenue, New York City. Owners, First Presbyterian Church, Rev. George E. Gillespie, Woodbury, N. J. Stone, brick, steel, 3 stories, 56x82 feet.

Residence, \$30,000. Princeton, N. J. Plans in progress. Architects, Hill & Gollner, Broad Street Bank Building, Trenton, N. J. Owners, Mr. and Mrs. Jones, care of architects. Stone, shingle, 2½ stories, 35x82 feet, slate roof, hardwood floors, electric light, tile work.

School, near Bridgeton, N. J. Plans in progress. Architects, Hill & Gollner, Broad Street Bank Building, Trenton, N. J. Owners, Hope-well Township School Board, L. A. Platts, R. D. 3, Bridgeton, N. J. Brick, steel, 2 stories, 70x132 feet, slate roof, maple floors, hollow tile, safety treads, dampproofing, bond (heating, plumbing and electrical work separate).

Passenger Station Facilities, Trenton Junction, N. J. Owners taking bids due July 25th. Engineer, Clark Dillenback, Twelfth and Market streets, Philadelphia. Owners, Reading Company, Twelfth and Market streets, Philadelphia. Reinforced concrete, brick, steel, steam heat, electric light, metal lath, tile, marble, terrazzo work, bond, ornamental iron work, bronze work, slate roof, cement floors, hollow tile, caulking, waterproofing and dampproofing, excavation, concrete and cement work, ornamental terra cotta, built-up asbestos roof, linoleum floors, plastering, slate work, plumbing, bronze grilles and thresholds, station building, 2 stories, 84x27 feet, west-bound waiting room, 1 story, 35x15 feet, passenger tunnel, platforms, platform shelters, stairways.

Water Supply Dam and Alterations to Filter Plant, Glen Gardner, N. J. Owners taking bids due July 25th. Architects, Division of Architecture and Construction, Charles J. Leatham, Director, State House, Trenton, N. J. Owners, Department of Institutions and Agencies, William J. Ellis, Commissioner, State House, Trenton, N. J.

Stowe Cottage, State Reformatory for Women, Clinton, N. J. Low bidders. Architects, Division of Architecture and Construction, Charles J. Leatham, Director, State House, Trenton, N. J. Owners, Department of Institutions and Agencies, William J. Ellis, Commissioner, State House, Trenton, N. J. Brick, reinforced concrete, steel, stucco, 2 stories and basement, 33x19 feet, slag roof, linoleum and cement floors, metal lath, tile, marble. General: Robert Canuso, New Brunswick, N. J., \$51,995; J. W. Wester, Metuchen, N. J., \$57,955. Plumbing: Elling Brothers, Somerville, N. J., \$6,510; Charles Leupold, 1466 Haddon avenue, Camden, \$7,284. Heating: Elling

Brothers, Somerville, N. J., \$5,912; Charles Leupold, 1466 Haddon avenue, Camden, N. J., \$7,674. Electric: Hoekenbury Electric Co., Somerville, N. J., \$2,497; Peter Peifer, Trenton, N. J., \$3,455.

Chapel, New Jersey State Home for Girls, Trenton, N. J. Low bidder: Maher & Hicks, 1042 Stuyvesant avenue, Trenton, N. J., \$48,683. Plumbing, W. G. Kashner, Roebling, N. J., \$2,160. Heating, Hadley Contracting Co., Fox Building, Philadelphia, \$2,908. Electric, Commercial Elec. Co., Newark, N. J., \$5,748. Architects, Division of Architecture and Construction, Trenton, N. J. Owners, Department of Institutions and Agencies, William J. Ellis, Commissioner, State House, Trenton, N. J. Reinforced concrete, brick, stone, steel, limestone, 1 story and basement, 95x42 feet.

New Jersey Contracts Awarded

Home for the Aged, King's Highway East and New Cooper River Drive, Haddonfield, N. J. Contract awarded Camden Construction Co., Camden, N. J., \$52,000, first 3 units. Architect, H. E. Hall, Merchantville, N. J. Owners, Order of Shepherds of Bethlehem, Charles E. Carr, Camden, N. J. Brick, steel, 2 stories, 145x32 feet, 40x32 feet, slag and slate roof, light concrete floors, bar joist, linoleum and wood floors, metal ceiling, dumb waiter, concrete foundations, vapor heat, electric light, metal lath, terrazzo and tile floors, plumbing. Building of fourth unit to be decided in October, \$12,000.

Church and School (alts. and add.), Maple Shade, N. J. Contract awarded Wills Bill Co., 1502 Locust street, Philadelphia. Architect, Emil G. Perrot, 1211 Arch street, Philadelphia. Owners, Our Lady of Perpetual Help Church, Maple Shade, N. J. Brick, steel, 2 stories, 49x135 feet, slate roof, maple and pine floors, cement work, metal lath, tile work, bond, ornamental iron work.

Terminal, Stores and Offices, Perry street, Trenton, N. J. Contract awarded Harrison & Fisher, 242 Cuyler avenue, Trenton, N. J. Architect, W. A. Klemann, First National Bank Building, Trenton, N. J. Owners, Central Transportation Co., Broad Street Bank Building, Trenton, N. J. Brick, concrete, 2 stories, 32x80 feet, slag roof, concrete and pine floors, copper fronts, metal ceilings (heating, plumbing and electric separate), tile, marble, steel sash.

Residence and Two-Car Garage, \$25,000. Atlantic City, N. J. Contract awarded M. B. Markland Co., Schwehm Building, Atlantic City, N. J. Architect, R. B. Williams, 118 North Quincy avenue, Margate, N. J. Owner, William C. Cuthbert, City Hall, Atlantic City, N. J. Brick, 2½ stories, hardwood and cement floors, tile work, steam heat, electric light.

Residence, \$5,200. 1158 North Twenty-ninth street, Camden, N. J. Contract awarded P. C. Sholl, State Highway, Burlington, N. J. Architect, private plans. Owner, Martin K. Knodle, Camden, N. J. Frame, 1 story, 20x40 feet, slate surface shingle roof, hot water heat, electric light.

Building (add.), \$3,200. 333 Arch street, Camden, N. J. Contract awarded Essaness Corporation, Fourth and Arch streets, Camden, N. J. Architect, private plans. Owners, Inter-County Mortgage & Finance Co., Southwest Corner Fourth and Arch streets, Camden, N. J. Brick, third story add., 20x68 feet 10 inches, slag roof, electric light.

Chimney, \$1,450. Broadway and Federal streets, Camden, N. J. Contract awarded

Charles E. Baxter, Merchantville, N. J. Architect, private plans. Owners, Immaculate Conception Church, Broadway and Federal streets, Camden, N. J. Brick, 70 feet high.

Road Work, New Jersey. Contracts awarded. Owners, State Highway Commission, A. Lee Grover, Chief Clerk, State House Annex, Trenton, N. J.

Route 29, Sec. 8, Chimney Rock to Washington avenue, Somerset County. Edward H. Ellis, Westmont, N. J., \$376,999.80.

Route 29, Sec. 7, bridges (5), between Raritan and Chimney Rock. Richards & Jaspon, Somerville, N. J., \$94,688.65.

Route 48, Sec. 21, bridges over Still Run and Elmer Lake, Malaga-Elmer, Gloucester County, N. J. H. Denberger Construction Co., First National Bank Building, Bethlehem, Pa., \$49,129.45.

Miscellaneous Construction News

Nurses' Home, Cumberland, Md. Plans being revised. Architects, Zantzing, Boric & Medary, Otis Building, Philadelphia. Owners, Cumberland Memorial Hospital, Cumberland, Md.

School, New Midway, Md. Owners will be ready for bids in about one week. Architect, J. B. Hamme, 31 West Market street, York, Pa. Owners, Board of Education of Frederick County, L. G. Palmer, Frederick, Md. Brick, 2 stories, 50x75 feet, slate roof, pine floors, roof ventilators, steam heat, electric light, metal lath.

Manufacturing Building, Tarrytown, N. Y. Architect taking bids due July 26th. Architect, Albert Kahn, Detroit, Mich. Owners, Chevrolet Motor Co., Detroit, Mich. Brick, reinforced concrete, steel, 1 story and basement, 1,200x400 feet (plumbing, heating, electric, sprinklers reserved), cement, tile roof, cement floors, rolled steel sash, bond, ornamental iron work, waterproofing.

Grade School, Minquadale, Del. Low bidders. Architects, Guilbert & Betelle, Chamber of Commerce Building, Newark, N. J. Owners, State School Building Commission, Dr. H. V. Holloway, Superintendent, County Building, Wilmington, Del. Brick, 1 story, 117x43 feet, timber roof construction. Jones-Redditt Co., McClatchey Building, Upper Darby, Pa., \$29,000; J. H. Hutchinson, Newark, Del., \$37,113.

School, Marshallton, Del. Plans in progress. Architect, C. R. Hope, DuPont Building, Wilmington, Del. Owners, Delaware Industrial School for Colored Girls, Marshallton, Del. Cinder block, stucco, 2 stories and basement, 30x150 feet, tile and asbestos shingle roof, maple and pine floors, electric light.

Central Heating Plant, Marshallton, Del. Plans in progress. Architect, C. R. Hope, DuPont Building, Wilmington, Del. Owners, Delaware Industrial School for Colored Girls, Marshallton, Del. Cinder block and stucco, 1 story, 20x30 feet, concrete floors, steel sash, electric work, fire doors.

Apartment (18-family), Dover, Del. Plans in progress. Too early for details. Architect, W. E. Hance, Equitable Building, Wilmington, Del. Owner, name withheld. Non-fireproof, 3 stories, irregular size, tile, marble.

Residence, State street, Dover, Del. Architects taking bids due August 1st. Architects, Pope & Manning, Equitable Building, Wilmington, Del. Owner, Jacob Ehrlich, 123½ Lockerman street, Dover, Del. Brick, stucco, 2½ stories, 30x40 feet, slate roof, hardwood floors, oil burner, electric light, tile work, steel casement windows.

Hartford War Memorial, Hartford, Conn. Work contemplated. Architect, Paul Cret, Otis Building, Philadelphia. Owners, City of Hartford, Conn.

Road Work, Delaware. Owners taking bids due August 13th at 2 P. M. (Eastern Standard Time). Owners, State Highway Department, Dover, Del.

Contract 119, The Levels Road, 3.96 miles. Excavation, borrow, cement concrete, reinforcement, metal pipe, R. C. pipe, concrete.

Contract 135, Farmington to Andrews ville, 2.2 miles. Clearing, grubbing, excavation, borrow, crushed stone, crushed slag, metal pipe.

Miscellaneous Contracts Awarded

Apartment House, Wilmington, Del. Contract awarded Karno-Smith Construction Co., care of J. A. Anderson, DuPont Hotel, Wilmington, Del. Architect, W. E. Hance, Equitable Building, Wilmington, Del. Owners, Twelve-Twelve Development Co., J. F. Darling, President, Christiana avenue, Wilmington, Del. Brick, reinforced concrete, limestone, 4 stories, 72x96 feet, tile and plastic roof, hardwood floors, hollow tile, elevators, roof ventilators, waterproofing and dampproofing, steel stack, incinerators, bronze, ornamental iron, fire doors, steel sash, tile, marble, metal lath, oil burner.

Roof Garden Addition, Wilmington, Del. Contract awarded J. S. Hamilton Co., 829 Orange street, Wilmington, Del. Architect, C. R. Hope, DuPont Building, Wilmington, Del. Owners, Wilmington Y. M. C. A., 908 King street, Wilmington, Del. Fireproof, 1 story, 40x70 feet, concrete roof, heating extension, electric light, steel sash.

Honor Building, Delaware Industrial School for Girls, Claymont, Del. Contract awarded Van Sant Brothers, 831 Tatnall street, Wilmington, Del. Architect, Walter Carlson, DuPont Building, Wilmington, Del. Owners, Delaware Industrial School for Girls, Claymont, Del. Stone, tile, 2 stories, 30x50 feet, 30x60 feet, slate roof, oak floors.

Residence (alts.) and Garage, Holly Oak, Del. Contract awarded F. G. Krapf, 421 Orange street, Wilmington, Del. Architect, E. C. May, DuPont Building, Wilmington, Del. Owner, Paul Hessler, Orchard avenue, Holly Oak, Del. Brick, stucco, 2 stories, 24x40 feet, slate roof, concrete and pine floors, electric light.

On August 1st, 1929, the Sterling Caulking Company, formerly of 2222 Chestnut Street, Philadelphia, will open new offices at 3835 Lancaster Avenue, Philadelphia. Their telephone number will be Baring 4230.

BUILDING TRADES COURSES

During the school year, 1929-30, the Wanamaker Institute will offer courses of vital interest to every concern engaged in the Building Trades.

The courses offered are:

Architectural Drawing—A two year course covering Elements of Architecture, Design, Descriptive Geometry, Detailing, Shades and Shadows, Perspective, and Architectural Drafting. It also includes a study of the History of Architecture.

Blue Print Reading—A three and one-half months' course for mechanics and

apprentices, who wish a working knowledge of Blue Prints in their respective line of work.

Mechanical Drawing—A four year course, which can be arranged to meet the requirements of each individual.

Estimating—A two year course, which aims to teach mechanics the use of money as a tool in the Building Trades. Arithmetic, Plan Reading, Quantity Survey, Estimates, Bids and Contracts are included.

Steel Square—A one year course. Especially worked out for carpenters, giving them *practical* instruction in the use of the Steel Square, particularly as applied to Roofs.

Building Trades Mathematics—A new, one year course. Intensive study of Mathematics applied to the Building Trades. It begins with the fundamentals of Common Arithmetic and continues on with Algebra, Mechanics, and the Strength of Common Materials.

GRADE-MARKING AS THE PRODUCER SEES IT

(Address by J. F. CARTER, Trade Promotion Manager, Southern Pine Association at Convention of National Association of Purchasing Agents at Buffalo, N. Y., June 3, 1929)

(Continued from issue of July 17)

Service is the watchword of industry today. As I stand before you at this moment you are the customer. If the manufacturer is to command more money for his product than does his competitor, he must perform an outstanding and valuable service. What greater service do you wish than the thought, the care, the training and the experience of the men who operate large sawmills, men who have spent their lives in the industry, who know which trees to choose, into what items every log should be cut, who use their training and knowledge of lumber to make the best product which can be made from each particular log?

Do you pay for a trade-mark, as some have said quite often when discussing this important subject of grade-marking, or do you pay for the quality which that trade-mark represents? When Andrew Carnegie, standing before a graduating class at Stevens Institute said, "If you can sell a hat for one dollar, you can sell it for two dollars if you stamp it with your name and make the public feel that your name stands for something." Andrew Carnegie used excellent language, and I am fearful that many have misinterpreted that sentence. Please notice that Carnegie made absolutely everything rest on the value of the name which the maker must stamp upon the hat if he is to sell it for two dollars. Merely stamp-

ing one's name on that hat will not make it saleable at two dollars if it be a dollar hat. But to put something into one's name, make the public believe it stands for something, is the great thing. Stamping a grade-mark on lumber does not raise the price—it guarantees the grade. And, please notice this: when that official grade-mark is stamped on a piece of lumber there is behind it the long years of training, the knowledge and the technical ability of men who know their raw material, the methods of fabricating that material into a product, and who know their product leaves their mills as a quality piece of goods. The grade-mark stands for something.

You have seen the famous Squibb advertising wherein they have laid stress on the value of the "priceless ingredient." The "priceless ingredient" is the name behind the product. In lumber the priceless ingredient is the grade-mark. That priceless ingredient is the one thing which, when put into a product, makes the public understand that behind that product something of great value stands—the brains, the ability, the knowledge of the man who produced the goods.

Packard uses a slogan "Ask the man who owns one." Could Packard lower the quality of the material which goes into its car and get the same price for any length of time? It could not. And why? Because the public would very soon lose confidence in the name, and the loss of that confidence would be irreparable. Does any manufacturer, working through the years to establish confidence in a name, deliberately take advantage of the public by lowering the quality of its products or by raising the price on its product because confidence has been established? It does not happen. Why should anyone insinuate that because the lumber manufacturer has answered the demand of the public by marking the official grades on his product, he is merely seeking a higher price? Such an insinuation against industry would lead one to think that honesty is not the best policy, when every one of us knows it is. The lumber manufacturer who is unafraid, who stamps the proper grade upon his lumber and puts it out with his guaranty behind it, is building for his industry a confidence which cannot otherwise be added.

Yes, there is a difference in price, in a tremendous number of cases in which comparisons can be made, as between lumber which is grade-marked and lumber which is not grade-marked. The grade-mark is not the cause of the difference in price. It is the quality which brings about the difference. I have heard many statements to the effect that there is just as good lumber without the grade-mark as there is with the grade-mark. That statement is correct. But can you purchasing agents choose the one with-

out the grade-mark which is just as good as the one on which appears the grade-mark? If you cannot, you are only safe when you require the mark and refuse to accept without the mark.

You have doubtless heard the statement, and you will probably hear it again today, that official inspections can be obtained if there be any doubt in your mind as to the grade of lumber you are getting. May I ask why, then, the lumber should not be properly marked as to its grades? Why have the expense of claim inspections, why have the expense of so-called certificates of grades, when it is so simple to have the inspector's stamp on each stick of lumber? When a farmer buys artificial fertilizer or any prepared food for his animals, the formula is printed on a tag attached to the bag. Does anyone ask for a chemical analysis, or does the farmer ask the manufacturer to send him a certificate of grade? He looks on the tag, reads the formula—and that is the grade-mark. Don't say there is any difference, for there is none. In both cases it is the guaranty of the manufacturer that he is delivering what he has been paid for.

Some of you may wonder what are the reasons for the lumber manufacturer's wishing to supply grade-marked lumber. Some have insinuated that it is for the ulterior purpose of raising the price. I know that statement has been made and has been promoted by many who are opposed to the practice of the grade-marking of lumber, though they preach in beautiful words about the principle. If the principle of grade-marking is good, the practice of it is far better, for you do not get any better lumber because groups of men believe in the mere principle. It is the proper grade of lumber you wish for your money.

Here lies the very potent reason why the thinking element among lumber manufacturers were happy to accept the suggestion of Mr. Herbert Hoover, when he was secretary of commerce, that they put the mark of the grade on every stick of lumber. So much juggling of grades had been practised and so much poor quality of lumber had been sold when high quality lumber and timbers were specified that lumber in many cases failed. Dry rot set in, strength was not present, too much shrinkage took place and other ills of this kind caused the particular lumber to fail. Did the owner of a plant or a warehouse or a residence blame himself or his architect or his engineer for having put the wrong quality or wrong grade into the building. Not a bit of it. Instead, he did what human beings always do. He blamed the failures on the entire product. About that time the astute trade promotion men for steel or cement or brick or stone called attention to their products, indicating the vast and innumerable cases

in which their products were used without a single failure. Steel won't rot. Concrete won't burn. Brick is one of the oldest building materials and does not burn nor rot and has no knots and does not shrink. But wood?—heavens, there is your own case to look upon.

If lumber grades had not been juggled in these years that have passed, and if proper qualities of wood had been employed in each place where it was used, these failures would not have taken place, and the substitute materials would have had a much more difficult time making headway. After a long number of years the lumber manufacturer has come to realize that it was not his product that was at fault—it was the wrong use of his product. The wrong quality was used for a given purpose or the wrong grade was used. Substitution in both cases. Eliminate the substitution and wood will come back to its place in the sun. It has a place, an outstanding one, and its importance in the life of man cannot be denied by the most ardent supporter of any other material if he be upstanding and straightforward.

The manufacturer asks only that he be allowed to give the purchasing agent what he really wants, what he really needs. He does not get a fair chance to properly supply the needs of the buying fraternity unless the purchasing agents strongly and forcibly require the proper grades and proper qualities.

I have mentioned quality often. There are certain uses where a soft, rapidly grown wood should be employed. There are other places where only the strongest of strong woods should be used. There are places which are continually dry; there are others where dampness is constant and where rot can set in if the proper resistance is not offered. Strength as a beam or post may be required in one use, durability against the elements in addition to strength may be required. These uses need different qualities. There are enough trade promotion men in the United States representing the various species of wood and also the National Lumber Manufacturers' Association to supply information to each of you. A simple request will bring a man from somewhere to discuss with you or your architects and engineers or your production men in the factories the uses to which lumber shall be put and the grade and quality which is best for the purpose. No guesswork is necessary with such organizations as the lumber fraternity has at your command.

In the South we have longleaf and shortleaf Southern Pine. There are places where you may use either shortleaf or longleaf. There are places where one or the other should be used. Trained men are waiting to answer your call. Let them tell you the quality and the grade you

need, and then require it to be grade-marked.

How about availability? You will probably be told this afternoon that there is not enough grade-marked lumber available to care for your demands if you require it. According to the latest figures of the National Lumber Manufacturers' Association there are at this moment 350 carloads of lumber being shipped each day from grade-marking mills. Is that enough to care for your requirements? Three hundred and fifty cars of lumber each day, six days a week, is a rather considerable amount with which to answer that statement about availability of supply. It is quite probable that those who have brought up the question of availability did not quite realize how much lumber is being grade-marked. Think of 350 cars each day, and remember there are six days each week. Also, that there are still large quantities of lumber not yet grade-marked but which will be marked so soon as the demand is seen.

Proof that structural steel can successfully carry its designed loads and withstand deterioration through corrosion and other sources has been afforded by careful analysis of the material which was removed from the Tacoma Building in Chicago. This was the first building of what is known as a "skyscraper" type of construction ever erected in the United States. It was a 13-story building, erected in 1887 by the George A. Fuller Construction Company. The building was designed by the architectural firm of Holabird & Roche, now Holabird & Root. In this type of construction the walls are supported on the steel framing. It differs from other construction in that previously walls were self-supporting. Holabird & Root, we understand, had the collaboration of Purdy & Henderson, bridge engineers, who had that day combined and improved upon the work of William LeBaron Jenney of the firm of Birnham & Root, who were also experimenting with skyscraper designs.

The engineering and architectural records pertaining to this building with the exception of the drawings were destroyed by fire; therefore the best evidence we have of the materials of construction was afforded by a careful analysis of the building during demolition. This disclosed the fact that the Tacoma Building had walls which were carried at each floor on steel spandrel beams attached to cast-iron columns. According to competent authorities writing on the subject it was in this building that was first seen the startling spectacle of bricklayers starting to lay walls midway between roof and ground.

Inspection of the drawings by the representatives of the American Institute of Steel Construction indicates it would seem

that the framework of this building was originally designed to make use of either rolled and fabricated shapes or cast-iron for all supporting columns. The cast-iron columns used to bear the perpendicular load had a circular cross section. This shape provided efficient strength and rigidity. Some of the columns were cast with four rectangular ribs spaced ninety degrees apart. They were bolted together from end to end, and were cast with brackets to which the beams were bolted.

Few rivets were used in the construction of this building. This results from the simple reason that the automatic riveter was not then invented. Such riveting as was done in the days when the Tacoma Building was erected was by a hand hammer which was known as a "flogging-hammer." This hammer had a long handle which gave added impress to the swing of the riveter. Rivets were used only in places where steel was joined to steel, and bolts where the steel was joined to cast-iron brackets. The rivet heads were all as neatly finished as any which might be observed in a modern structure of today. Only brick and tile were used to cover the steel framework. That was the total protection offered the structural members during the forty-two years the building was standing.

The Illinois Society of Architects, we are informed, appointed a committee to make an examination of the condition of the material in the building as it was wrecked. Henry Penn, District Engineer of the American Institute of Steel Construction, located at Chicago, also submitted samples of the material to Robert W. Hunt Company, engineers of Chicago, for careful investigation. A report of the Hunt Company, signed by G. B. Givault, states:

"We are tabulating below the results of the analysis of one sample of metal frame submitted to us on same date, and designated as material taken from the Tacoma Building, Chicago:

	%
Carbon	0.12
Manganese	0.40
Phosphorous	0.063
Sulphur	0.032

"The above analysis indicates this material to be steel and not wrought iron. The manganese content is especially significant. An etching test made on a portion of the metal frame further verifies this conclusion."

The steel from the old building has been subjected to chemical analysis, etching and microscopic examination. There has been no evidence of deterioration in the crystalline structure, and it is believed that the framework of this building would have been good and efficient for many years to come. Original location markings

in paint were as fresh and bright as when the beams were first covered. The material in the webs of the beams as originally rolled was less than one-quarter inch in thickness, yet was still perfect and capable of carrying their loads when the sections were removed.

MORTAR JOINT ABLE TO MAKE OR BREAK THE EFFECT OF BRICK IN THE WALL

Three elements must be carefully considered in dealing with the mortar joint—its color, its texture and its size and kind. The color of the mortar joint may be such as entirely to destroy the beauty of the brick. On the other hand, if it is properly chosen it will bring out the fine shades and tones of the brick in such a way as to enhance very greatly its natural beauty.

Then the mortar joint has a certain texture which is produced either by finishing it rough or smoothing it with the trowel or a tool made for that purpose. This mere treatment of the surface of the mortar joint has more to do with the appearance of the wall than one might at first suppose.

In addition to that, the size of the mortar joint, running from a thin "battered" joint up to an inch in width, affects the color relation of the whole surface, and the kind of joint, whether cut flush, raked out or tooled in various shapes, has a distinct bearing on the whole effect.

In a word, do not neglect the mortar joint, for it is one of the most important elements that go to make up the beautiful fabric of the brick wall, in the building of which there is deserved and required the exercise of a fine discriminating taste.

—*Permanent Color.*

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

write practically every form of Insurance, except life*

**Driving Rains and Salt Sea Air Cannot
Penetrate or Stain These Brick Walls—**

**They're Waterproofed with
"ANTI-HYDRO"**

Although this large hotel is situated on the ocean front at Asbury Park, New Jersey, the walls are always dry and the brick cannot stain from efflorescence coming from the mortar joints. That's because the cement mortar is mixed with "ANTI-HYDRO."

Driving rains, wintry winds and salt sea air have no effect on this masonry.

"ANTI-HYDRO" waterproofs and dampproofs portland cement mortar, and concrete permanently. Its small additional cost guarantees dry and stainless walls and is a profitable investment for any building, large or small.

Being a liquid compound which mixes readily with water, "ANTI-HYDRO" is extremely easy and economical to use. No additional labor is required for the mixing. And in addition to its many other advantages, "ANTI-HYDRO" makes cement mortar extremely plastic so that it spreads more easily. Use "ANTI-HYDRO" for your next brick job.

Reinforced concrete, brick, steel, 2 stories and basement, 123x38 feet, slag roof, wood roof deck, cement, oak and pine floors, hollow tile, plumbing, caulking, waterproofing, architectural terra cotta, steel partitions, steam heat, electric light, metal lath, tile, marble and terrazzo work, bond, copper bulks, ornamental iron work, metal ceilings.

The Scientific Book Corporation, 15 East Twenty-sixth Street, New York, has recently published the fourth revised and enlarged edition of "Steel Square Pocket Book," by Dwight L. Stoddard.

This concise and handy little book illustrates and describes the best methods of using the carpenter's steel square. It answers every problem that is likely to come before the practical carpenter in his every-day work.

One feature of this book is the absence of reference letters on the illustrations. Instead of reference letters an exact engraving of the square is given, laid on the work, showing at a glance all points, lengths and quantities sought.

The new edition is made in a compact and handy size to carry around in the pocket. It has a flexible binding. The price is \$1.00 postpaid.

THE IMPORTANCE OF REGIONAL PLANNING

An Address by J. R. FAIRMAN, Manager, Southeastern Offices Portland Cement Association, before the Florida League of Municipalities, St. Augustine, Florida, June 27, 1929

Nearly everyone has in mind some city improvement he thinks would be of great benefit; one man wants the street on which he lives paved; another wants a park established; still another believes a certain street should be widened; this man would like to install a new system of traffic lights; and so on. With all this disunified thinking and planning, I sometimes am forced to wonder how many communities have achieved any semblance of order.

Almost overnight the automobile has changed our mode of living. Through the ability of the individual to get easily about the country, a new standard of living and of education has developed. A city is no longer self-contained; its pros-

perity and development depend to a large degree upon the prosperity of an entire region.

Chief among the several problems confronting the modern city is the provision of adequate facilities for motor traffic. Suburban districts have long existed, but never in all history has their relationship to the city been of such importance and concern as at present. Suburban areas are expanding; cities and their suburbs are now growing together; and the automobile is bringing remote communities nearer to the city. Haphazard growth must be halted, in the face of such tendencies, if a full measure of community efficiency, comfort and beauty is to be attained.

Progressive, populous communities in many parts of the country have adopted regional planning as the medium best adapted to handling this perplexing problem. City planning is not broad enough; our communities are bursting out at the sides. There are greater opportunities in adjacent areas than in the city proper. The picture puzzle of community needs must be solved by trained minds, made available through some such agency as a Regional Planning Commission, whose duties include the analysis of all such factors as population increase, suburban growth, vehicle registration, both present and future, expected industrial development, residential trends, zoning, finances available for improvements, and many other items. Equipped with facts, this Commission will make recommendations and co-operate with other existing agencies to the end that a regional plan of a comprehensive, forward-looking nature will be carried out.

Obviously your Florida cities are to continue growing. I understand that the mayor of Miami during the last winter

season presented more than 100 notables with keys to that city. This is but an indication of what may be expected in the future.

I had realized, of course, that city populations in Florida were increasing, but I must admit I was somewhat startled to learn that since 1925 the population of Jacksonville has increased by 60 per cent.; Tampa, by 85 per cent.; Miami, by 128 per cent.; and St. Augustine, by 80 per cent.

These growths are phenomenal; yet there is every indication that Florida cities are to continue attracting citizens at a high rate. Your cities still have time to convert themselves into communities that are modern in the fullest meaning of the word.

Unfortunately, regional planning did not exist when most of our cities were created. Without knowledge of the changes to be wrought by the automobile, or of the great size to which cities would grow, the early planners neglected to provide for logical and directed growth. Streets, for instance, were rarely of more than the age old four-rod width. Of all the American cities, with the exception of the nation's capital, the only one I can call to mind that made any early attempt at planning for the future, was Detroit.

That city was destroyed by fire nearly one and a quarter centuries ago, as were so many early communities. Afterwards, a prominent Detroit citizen, Judge Woodward, and Governor Hull of Michigan, were responsible for laying out a new Detroit, a Detroit with thoroughfares of three widths. Streets of minor importance were made 60 feet wide, secondary radial arteries, 120 feet, and major arteries, 200 feet. This was a marvelous thing, but sadly, later generations, unable to visualize the Detroit of the future, encroached

on these wide rights-of-way and today only a few remnants are in service.

Loss of these broad streets, which would so well have served today's traffic, was a costly thing for Detroit. That city is still paying for it through traffic congestion and through time and money consuming condemnation proceedings and other means to gain back a portion of that space once devoted to streets. All of this would have been avoided through adherence to the original far-seeing plan.

But what Detroit lacks today in extra wide downtown streets, she has made up for in suburban development. A Master Plan has been adopted that serves as an object lesson for Florida municipalities. This Master Plan embraces a comprehensive system of wide roads, many of which are already completed, thereby permitting fluidity of present traffic. This plan is a continuing plan; each year definite progress is made toward lengthening the mileage of pavements, none of which is less than 40 feet wide. In the Detroit region they have a battlecry: "Acquire wider rights-of-way today!" To this might well be added the phrase "for tomorrow they will cost more money."

The Master Plan predetermines the position of the transportation avenues which form the skeleton of the street system in the outer areas. It provides for superhighways, 204 feet wide, at three-mile intervals, designed to offer local and through roadways for motor traffic on each side of a center zone reserved for rapid transit service, or future widening or other development. Intermediate roads 20 feet wide are located at mile intervals on section lines. A supplementary system of major thoroughfares 120 feet wide is established at intervals of

approximately three-fourths of a mile within the area of present development.

That is indeed an ambitious plan; yet it is already well under way. Words can scarcely convey a true picture of what Detroit and Wayne county have done; I would suggest that if any of you have the opportunity, you spend a week-end in and near the Motor City.

Many factors enter into city expansion and development. These are of such a serious nature as to require scientific and thorough study of all the principles involved in order that tax payers may be provided with the facilities and conveniences which are their just due. You will grant, I am sure, that little would be accomplished without some central fact-collecting body to study all the proposals, pushing through to completion those best fitted to the community welfare.

Stated in its simplest form, the purpose of the Regional Planning Association is to make an intensive study of all the factors entering into the community's growth and welfare, so the greatest convenience and comfort may be obtained for the tax dollar. The costly experience of a certain Illinois community must be avoided. There, a splendid 40-foot pavement was built out into the country, but unfortunately it ended abruptly in a corn field and was of no use whatsoever to the community for a couple of years.

Chief among the problems facing all communities is that of transport. Adequate transport service not only means that railroads and street railways must be well connected, but also that highways and streets shall form a perfect network of main arteries and secondary roads. Street layouts marked by dead-ends, jogs, narrow widths, poor pavement and a total

lack of co-ordination, must be avoided. Industrial traffic must be studied so heavy trucks can be accommodated without hindrance to passenger vehicle traffic. On the other hand, high speed thoroughfares must be constructed so passenger cars will not be unnecessarily delayed by trucks. Through traffic should also be taken care of. The idea that motorists whose destinations are far away should be directed through the downtown section of cities is now old fashioned. By-pass routes must be provided so this traffic can continue on its way unhampered, and what is more important, with no inconvenience to the home community.

Water and sewage must be given careful attention in the makeup of the up-to-date community. The automobile has made it possible for the downtown worker to establish his home in the outer precincts of the city or even out in the country. Sanitation must be carried to him. Villages and suburban centers must co-operate, for in this co-operation the citizen is given better service with complete safety and at lower cost. Without planning, it is too easy for much needed projects to be neglected and to become political footballs. In the Passaic Valley of New Jersey, for example, a trunk sewer now serves a thickly populated region embracing quite a number of separate municipalities. It was proposed to establish this sewer more than twenty years ago, but endless litigation and negotiation was necessary before it became a reality. All this delay was at the public's expense.

Even in the matter of public utilities, the way is open for the city to accomplish a great deal through early planning. Electricity and gas reach out everywhere. Electric lines and conduits through town and country possibly may conflict with the highways. Early planning of highway improvements will give the utility firms an opportunity to develop their facilities for the best interests of the public and also it will aid them in preventing a later conflict for right-of-way.

One of the greatest achievements open to the Regional Planning Association is the overcoming of problems which I shall call political for want of a better term. The boundaries of governmental units in any region are irregular and often without reason—illogical results of haphazard growth. Areas of municipalities are often either so restricted as to hamper growth, or so extended as to impose some undue burden on the well occupied districts. In the case of the region of Chicago, there are almost exactly 1,000 separate taxing bodies within 50 miles of the downtown section of that city. You are of course not bothered to that degree in Florida. Nevertheless, real progress depends upon the complete co-operation of all governmental units involved.

Here are some of the chief aims of the

Chicago Regional Planning Association:

Adequate pavements on every main highway in the region of Chicago, continuous across state, county and city, and their boundary lines.

Adequate paved street connections with the paved highways.

All bridges wide enough for future pavement widening or built so that they may be widened.

Grade separations at all dangerous railway crossings.

Grade separations at the most important highway intersections.

Uniform traffic regulations in every county, city and village region.

Every highway marked only with official, legible signs of cautions and direction.

Every main highway adequately lighted at night.

Trees planted and maintained along every highway for the comfort and delight of all highway users.

Attractive public comfort stations properly located along all important highways.

Chicago, large in itself, is the center of a populous territory and the regional planning problems there are intensified. Nevertheless, the smaller city is faced with the same troubles and identical improvements must come sooner or later.

Let us look for a moment at the program of a small community—Riverside, California, with a population of about 25,000. Riverside has already made remarkable progress and the improvements mapped out for that city bid fair to make it one of the most attractive in the country insofar as appearance, comfort and ease of traffic movement are concerned. Climate is, of course, another matter.

The steps being taken in Riverside are:

1. Regulation to secure maximum capacity of existing space, including elimination of auto parking, prohibition of obstructive turns at particularly busy intersections, ranking of vehicles, use of most effective signaling, curtailment of unnecessary movements and so forth.

2. Improvement of existing street plan, including elimination of jogs and dead-

end traffic streets, creation of distributor and by-pass streets for the business district, and improvement of radial and inter-district thoroughfares of the major street plan.

3. Extension of a regional major street plan to cover the whole district for several miles in each direction outside the city limits, and completion of a boulevard and parkway system plan supplementing it.

4. Provision for the readjustment and extension of railroad lines, with gradual elimination of grade-crossings.

Regional planning is, of course, quite new and I am much pleased that some of your Florida cities are giving serious consideration to this planning movement. If anything, your problems are more intense than they are in any other part of the country. Florida is growing rapidly, you have a marvelous tourist business, you have an established clientele of winter pleasure seekers. Naturally cities in a state so blessed, will grow faster than the average American city.

Jacksonville, I understand, has a city planner, who is not only confronted with traffic and expansion problems within Jacksonville, but is also obliged to consider the whole of Duval county. Obviously, he must take into consideration the principal arteries of travel into Jacksonville, such as State Road No. 1 from the West and No. 4 from the North and to the South, as well as others.

Travel in that city at present across the St. John's River is over one bridge and by one ferry. Clearly, any comprehensive municipal plan must take into consideration the ever increasing need for additional trans-river transportation facilities. New bridges should be located so as to relieve as much of the intra-city traffic as possible, and provide easy crossing of the St. John's River for through traffic as well as local traffic.

Jacksonville's situation definitely indicates why the modern city must extend its city planning to planning in which the whole region is considered. Tampa presents a problem of similar character. Broad thoroughfares leading into the city

must be so located and built as to conform to a plan of the greatest possible utility to the city itself.

Miami has already made noteworthy progress through the building of wide arteries. Biscayne Boulevard, 220 feet wide over an eight-block length, is an excellent example of the type of facility that must be installed if there is ever to be room for the prolific automobile. One of the great difficulties of this modern age is finding a place to park. From this standpoint Biscayne Boulevard is something of a motorists' heaven. For 2,000 cars may be parked along it without hampering travel. You can well imagine what impression Biscayne Boulevard will make on the tourist or home seeker. That latter important individual, particularly will feel, "Here is a city that is progressive, a city that is attempting to make things comfortable for its citizens. I will make my home here."

If your city is smaller than Tampa, Miami and Jacksonville, that does not mean you are freed from the responsibility of regional planning. In fact, it is just as important in the small city as in the large, and frequently more important, for the small community must have something to offer in place of large hotels, office buildings and theatres. Here is St. Augustine there is every indication that before long an improved throughroute will be needed. Because there is so much of historic interest in this community and so much that must be preserved to the nation for all time, it is highly improbable that the widening of thoroughfares through the old section of the city will be contemplated. However, the ever increasing traffic through the city will shortly demand a broad pavement acting in the nature of a by-pass so the present narrow and winding route may be relieved.

Superhighways, roads of more than the usual width, elevated street intersections, railroad grade separations, and pedestrian tunnels are a few of the modern facilities forcing themselves into the up-to-date traffic picture. These improvements are no longer regarded with doubt, for cities

1530 CHESTNUT STREET
PHILADELPHIA

in many parts of the country have through experimentation proved that they are absolutely practical. One great elevated street separation in Lincoln Park, Chicago, has increased the traffic capacity of Lincoln Park thoroughfares by 300 per cent. That is to say, this one structure has given, in effect, three additional roads. These elevated intersections, wherein one street or road passes over the other, permitting traffic to flow in all four directions continuously and safely, must be placed at strategic points.

The benefits of railroad grade separations are obvious. Surveying accident records, it appears that nothing will eliminate accidents at grade crossings except construction of a bridge over or a tunnel under the tracks so motor and train traffic never will meet.

Wide streets and wide rural roads must be included in every adequate transportation scheme. Thirty years ago the average motor vehicle required a lane only 7 or 8 feet wide in which to move with ease and safety. Since then the average vehicle width has been increased, the maximum generally being 8 feet. Ordinary speed of travel has doubled or tripled and vehicles have grown tremendously in numbers. Street and highway authorities are agreed that, in metropolitan areas at least, the lane of pavement for moving traffic should be ten feet wide; for parking parallel to the curb it should be 8 feet; and for diagonal parking, 18 feet in width, the latter dimension convertible into an added lane for moving traffic with parallel parking. These lane widths are considered minimum for safety and free movement of traffic under all conditions of light, darkness, rain or dry weather. They are also considered maximum, because a slightly wider lane invites the crowding in of another car, which is dangerous.

The superhighway may roughly be defined as a roadway of ample width for the accommodation of four or more lanes of traffic. Of great importance, is the placement of these superhighways. They should be so located that the largest number of motorists will be benefited. Superhighways should be built first where they are most needed. Naturally the only way to determine where wide arteries should be built, is by means of a traffic survey. Traffic as it seems and as it actually is, often are two different things. For instance, a traffic count taken at Buffalo, N. Y., revealed figures that surprised even those fairly conversant with that city's traffic problem. More than 50,000,000 vehicle movements across the city line took place in 1927, a daily average movement of over 138,000 vehicles! Other surveys conducted by cities and states throughout the country have in many instances revealed that heavier traffic exists on certain roads than was expected.

Here again there is a definite need for the Regional Planning Association. Varying interests in the community, the ability to pay for additional civic improvements, and anticipated future community growth, must be considered in location of such thoroughfares.

Another paramount issue is the matter of rights-of-way. The procedure followed by the superhighway commission of Macomb and Wayne and Oakland and Wayne counties, surrounding Detroit, indicates what must be done in all communities expecting to grow. This commission, in anticipation of future highway needs, is acquiring right-of-way of varying width up to 200 feet. The width of the original road surface has been predetermined. In the future when additional road surface is needed, pavements will be laid without any delay whatsoever.

The regulation of the use of private property by a public agency, through zoning, has become well established as a function of government. But what is done by zoning bodies and engineers in the way of placing restriction upon the free use of private property must have a lasting effect upon the community whether the work is well or poorly done—whether the ordinance is well or poorly administered. It is desirable, of course, that the results be the best obtainable.

Through the medium of the Regional Planning Association, and the thorough studies which can be made by such an organization, proper city zoning may be accomplished.

After all, the metropolitan community can be regarded as a child; it must be properly nourished and its development must be properly guided. Clearly, there should be some ruling, guiding hand to correlate the manifold activities of government along this line.

There is no governmental agency authorized or qualified to do the work for a city and its environs too. Whatever is to be accomplished must come through the activities of the citizens themselves. The body necessary to do such work must be non-political, or it must carry on a unified plan through year after year of changing governmental officials. The regional planning associations built up by Chicago, Buffalo, St. Louis and many other cities, have demonstrated the need for such progressive scientific bodies. The modern city is growing more complex. Changes in the organization of the city must come about if it is to keep pace with the changes in our living standards. More is expected of the community than ever before; pure water must always be on hand; streets must be smoothly paved; the schools must be excellent; the parks must be spacious and clean; sewage disposal must be never failing; protection from fire must always be at hand.

All these things cost money, and their costs are personified in the taxes collected by the various governing bodies. If the citizen can be made to realize that the conveniences furnished by his government are in reality part of his personal wealth, that actually through many improvements he receives more than he pays for, he will become more willing to support the improvements which modern conditions require.

All taxpayers are naturally interested in economy; they must be assured that their money is being properly expended. They are demanding that the principles of private business be adopted in conduct of the business of government. The business that is permitted to run itself cannot be as profitable as one that is carefully and thoughtfully directed. Through the medium of a Regional Planning Association the community's growth and future are safeguarded, its funds are most effectively invested in dividend-paying improvements, and its energy is most efficiently employed.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public associations tending to overcome the natural habit of procrastination.—Making advertising pay.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

**Driving Rains and Salt Sea Air Cannot
Penetrate or Stain These Brick Walls—**

**They're Waterproofed with
"ANTI-HYDRO"**

Although this large hotel is situated on the ocean front at Asbury Park, New Jersey, the walls are always dry and the brick cannot stain from efflorescence coming from the mortar joints. That's because the cement mortar is mixed with "ANTI-HYDRO."

Driving rains, wintry winds and salt sea air have no effect on this masonry.

"ANTI-HYDRO" waterproofs and dampproofs portland cement mortar, and concrete permanently. Its small additional cost guarantees dry and stainless walls and is a profitable investment for any building, large or small.

Being a liquid compound which mixes readily with water, "ANTI-HYDRO" is extremely easy and economical to use. No additional labor is required for the mixing. And in addition to its many other advantages, "ANTI-HYDRO" makes cement mortar extremely plastic so that it spreads more easily. Use "ANTI-HYDRO" for your next brick job.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

Bair, President, 18 East Orange street, Lancaster, Pa. General, J. Irvin Brenner, 116 East Ross street, Lancaster, Pa., \$6,832. Plumbing, P. E. Gutfleisch, 358 North Queen street, Lancaster, Pa., \$1,487. Heating, P. E. Gutfleisch, 358 North Queen street, Lancaster, Pa., \$2,196. Electric, J. W. Lippold, 107 West King street, Lancaster, Pa., \$281.80.

Residence and Garage, near Phoenixville, Pa. Contract awarded J. Morris Rossiter, Wayne, Pa. Architect, R. Brognard Okie, 306 South Smedley street, Philadelphia. Owner, Gerry M. Cox, 1421 Chestnut street, Philadelphia. Stone, 2½ stories, shingle roof, hardwood floors, hot water heat, electric light, tile work.

Mechanical and Administration Building, near Doylestown, Pa. Contract awarded John S. Bailey & Bro., Doylestown, Pa. Electric, Elias Nusbaum & Brother, 2023 Sansom street,

Philadelphia. Architects, Silverman & Levy, Thirteenth and Chestnut streets, Philadelphia. Owners, National Farm School, S. B. Samuels, Doylestown, Pa. Stone, brick, cinder block, stucco, 2 stories, 100x50 feet, slate roof, linoleum floors, vacuum heat, metal lath, tile and terrazzo work, rolled steel sash and skylights, kalamein doors, dampproofing, limestone, blue-stone.

Residence and Garage, Allentown, Pa. Contract awarded W. H. Gangwere, A. N. B. Building, Allentown, Pa. Architects, Karcher & Smith, 1520 Locust street, Philadelphia. Owner, John Saeger, Allentown, Pa. Stone, 2½ stories, vapor heat, electric light, tile work, slate roof, hardwood floors.

School (add.), Johnson avenue, Upper Chester Township, Pa. Contracts awarded Sennett Brothers, Boothwyn, Pa. Plumbing and heating, W. T. Fowden, Chester, Pa. Electric, John R. Longhead, Chester, Pa. Architect, Frank C. Watson, Crozer Building, Chester, Pa. Owners, School District of Upper Chester Township, M. H. Young, Boothwyn, Pa. Brick, cement block, 1 story, 32x24 feet, asphalt roof, slate blackboard, bond.

Residence, Reading, Pa. Contract awarded Wyomissing Development Co., 832 Penn avenue, Wyomissing, Pa. Architect, W. H. Dechant, 632 Washington street, Reading, Pa. Owner, R. E. Pendergast, 43 North Sixth street, Reading, Pa. Brick, 2½ stories, slate roof, electric light.

Store, Market street, Harrisburg, Pa. Contract awarded O. L. Armiger, Camp Hill, Pa. Architect, C. H. Lloyd, Telegraph Building, Harrisburg, Pa. Owner, Hyman Morrison, 3314 North Second street, Harrisburg, Pa. Cast stone, brick, steel, 3 stories, 30x120 feet, composition roof, maple floors, city heat, electric light, metal lath, tile work.

Residence (alts. and add.), Reading, Pa. Contract awarded J. J. Coyle, Shillington, Pa. Architect, C. J. Young, 226 North Sixth street, Reading, Pa. Owner, E. E. Frederick, care of architect. General interior alterations, tile work, hardwood floors, Warren Webster heat, electric light.

School (alts.), Northampton, Pa. Contract awarded Tamaqua Construction Co., Tamaqua, Pa. Plumbing and heating to J. M. O'Donnell, Quakertown, Pa. Architect, G. C. Freeman, 24 North Sixth street, Reading, Pa. Owners, Our Lady of Hungary Roman Catholic Parish, Rev. P. J. Repchik, Pastor, Northampton, Pa. Brick, stone, composition roof, asphalt floors, electric light, new plumbing.

Contract No. 3, West Plaza Approach, Com-

pletion of Soldiers' and Sailors' Memorial bridge, Harrisburg, Pa. Contract awarded James McGraw Co., Commercial Trust Building, Philadelphia, \$722,657. Architects, Gehron & Ross, 101 Park avenue, New York City. Consulting engineers, J. E. Greiner Co., Lexington Building, Baltimore, Md. Owners, Commonwealth of Pennsylvania, B. E. Taylor, Capitol Building, Harrisburg, Pa.

Overhead Bridge, 3935, Route 142, Lincoln Highway, West of Coatesville, Pa. Contract awarded T. J. Foley Co., 1825 Cypress street, Philadelphia. Engineer, E. R. Temple, Engineer of Bridges and Buildings, Pennsylvania Railroad, Broad Street Station, Philadelphia. Owners, Pennsylvania Railroad Company and State Highway Department, care of Pennsylvania Railroad, Broad Street Station, Philadelphia. Steel, concrete, 157x92 feet, steel and reinforcing.

Road Work, Pennsylvania. Contracts awarded. Owners, Pennsylvania Department of Highways, Harrisburg, Pa.

Somerset County, R-119, Sec. R-1, Jenner Township. One course reinforced concrete, grading and drainage. D. E. Keller & Son, Somerset, Pa., \$57,979.10.

The 20th edition of MacRAE'S BLUE BOOK consolidated with Hendrick's Commercial Register has just been issued.

MacRAE'S BLUE BOOK is produced by a corps of men of many years of experience. Every conceivable commodity that is manufactured is listed in its columns. This book is used by the greatest industries in the world in specifying or buying equipment and supplies.

The 20th edition of MacRAE'S BLUE BOOK contains an Address and Local Distributors' Section, a Classified Material Section, and a Trade Name Section. It carries eighty per cent. more firm name listings than does its nearest competitor. The headings of the classifications are arranged to give the greatest volume of information in the most compact form for convenient use.

MacRAE'S BLUE BOOK should be of valuable assistance to the architectural and building trades. It will be sent postpaid anywhere on receipt of \$10.00. Orders will be taken by the BUILDING NEWS PUBLISHING COMPANY, 1530 Chestnut Street, Philadelphia, or may be sent direct to MacRae's Blue Book Company, 10 East Huron Street, Chicago, Ill.

SOLVING THE APARTMENT HOUSE ANTENNA PROBLEM

With the growing popularity of radio in cities, the apartment house antenna problem has assumed serious proportions. This problem has to do with the unsightly maze of tangled antenna wires and poles seen on the roofs and down in the court yards of America's apartment houses today. Yet tenants must have their radio. No landlord dares interfere with the pur-

suit of happiness by his tenants. Each tenant is usually left to follow his own ideas regarding a suitable antenna. And the landlord is helpless in the matter, since any objection to radio these days is tantamount to an empty apartment house.

Indoor antennas, socket-antenna devices and loop antennas are not a solution of the problem. Experience has shown that these devices are usually unsatisfactory in the modern fire-proof apartment house, owing to the steel construction. Also, such devices are subject to excessive inductive interference from electric motors, elevator contractors, electric refrigerators, electric household appliances, and so on.

Having specialized in antenna problems of all kinds for several years past, three well-known radio engineers were assigned the task of evolving a simple, inexpensive and altogether practical antenna system for the average apartment house. These engineers, Ernest V. Amy, Julius Aceves, and Frank King, operating as the consulting engineering firm of Amy, Aceves, & King of New York City, undertook an exhaustive study of the subject, made many experiments with various devices and arrangements, and finally developed and patented an entirely new antenna circuit arrangement which meets all requirements.

The basis of the new apartment house antenna system is a device known as the multi-coupler. This comprises a bakelite case 6 inches long and 1½ inches in diameter, containing the necessary circuit components. The case has connecting lugs at top and bottom and a binding post on the side. There is nothing to wear out or to renew in the multi-coupler. It provides satisfactory service over many years, without additional expense of any kind.

With the multi-coupler as the basis,

the new apartment house antenna system is simplicity itself. As many as 25 radio sets may be operated on a single or common antenna by means of one multi-coupler for each radio set, but a fair average of 12 to 15 is followed in practice. Briefly, a common antenna is installed for every 12 or 15 radio sets in the apartment house. The down lead from the common antenna, instead of being brought to a single radio set as in usual practice, is brought down alongside the wall of the house and close to a vertical row of windows, thus catering to the needs of a row of apartments. The down lead carries a multi-coupler at the level of each floor, or near the window for that floor. There are as many multi-couplers as there are floors in the vertical row. The binding post of the multi-coupler serves as the antenna connection for the radio set of the apartment. At the bottom of the down lead there is installed a lightning arrester with a high resistance shunted across it, so that the antenna system is protected from lightning in accordance with the requirements of the fire underwriters.

With this antenna system, each radio set owner has the use of an excellent antenna of far better characteristics than the usual antenna of today. Furthermore, the multi-coupler serves as a filter, passing mainly the broadcast frequencies to the radio set. Therefore, inductive interference of electric motors and household appliances is reduced to a minimum. However, when short-wave reception or television reception is desired, the apartment house tenant simply winds four or five turns about the down lead, above the multi-coupler, and thereby secures the advantages of an outdoor antenna about 20 feet long.

In the average apartment house installation of the multi-coupler antenna system, each row of apartments is served by a common antenna. For a neat arrangement, the common antennas can be arranged in the umbrella form, supported at the center by a pole, water tank or other suitable structure. There is a down lead for each vertical row of apartments.

Several apartments in New York City have already been equipped with the multi-coupler antenna system and highly satisfactory results have been obtained. It will be noted that this system lends itself to old as well as new apartment houses, since the entire installation may be placed on the outside of the building, if so desired. The cost of the system, both for materials and for labor, is remarkably low. The installation is neat, inconspicuous, yet exceedingly handy for each tenant. There is nothing to replace or service, so that there is no maintenance cost.

All in all, the apartment house antenna problem appears to be satisfactorily solved for owner and tenant alike. The pursuit of happiness in radio terms can continue unhampered.

WHY PRE-QUALIFICATION SHOULD BE REQUIRED OF ALL BIDDERS ON PUBLIC WORKS CONTRACTS

By WILLIAM T. FIELD, *Consulting Engineer*

To require a contractor to be qualified before receiving a contract for public work is only logical. He should be not only experienced and reliable, but financially able as well.

For a contractor to be really qualified, it should not merely be required that he furnish a surety bond or that he have sufficient financial resources. Generally speaking, it is not difficult for a contractor to obtain a surety bond on a contract; and in substance all that a surety bond says is that somehow, sometime, the work contracted for will be completed.

It has been suggested that bonds be furnished to guarantee payments for labor and materials, in addition to a performance bond, but actually the only ones who really profit by such bonds are those who sell them.

There are twenty-four state highway departments and many municipalities which have adopted the policy of qualifying bidders before permitting them to enter into a contract for construction. This policy eliminates many difficulties that naturally attend public work. Most contractors who are not qualified and responsible so far as that particular work is concerned will not attempt to bid where qualification is required. Court decisions do not consider that the mere furnishing of a surety bond qualifies a bidder to receive a contract. In fact, many decisions have declared specifically to the contrary. Surety companies have often declared that they have never presumed to guarantee the responsibility of a contractor, but merely that, in event of default, they would assume certain liabilities which differ greatly under conditions.

The municipality should know the actual financial status of a bidder, in substance his liabilities and his assets, rather than be compelled to take his apparent financial standing as represented by his certified check and bank balance.

Qualifying Should Be Done Before Bidding

To attempt to properly qualify contractors after bids are opened places the officers or board in a position where they are charged with favoritism, unfairness and dishonesty whenever it becomes necessary to reject a low bidder as not responsible.

Certainly it is not fair to a bidder to require qualification after bidding, as there is usually considerable work and expense entailed in properly preparing a bid. Then, too, it places a contractor in an embarrassing position, as well as the awarding official or board, if it is declared that the apparent low bidder is not the acceptable lowest, responsible bidder on a job.

Should not the same amount of care and consideration be given in determining who is a responsible bidder on public work, where we are spending the taxpayer's money, as we would give to the bidder on private work? The prequalification of contractors is not a new idea. It has been in operation for many years with private interests, public service corpora-

tions and individuals. There is hardly a public official who would consider awarding a personal contract to a party from whom he did not have confidence that he would receive a good job. The contractor's qualifications should certainly be predetermined.

Necessary Requirements

The first of these qualifications is the contractor's skill or ability, which is a factor often overlooked in the awarding of both public and private contracts. Even the engineering profession has been guilty at times of assuming that any person equipped with plant and a little money or credit could execute a complicated construction project. Obviously, there is no mathematical formula for computing a bidder's skill, but a reasonably accurate idea can be gained from his record of previous construction projects successfully completed.

The second factor in qualifying is the bidder's reputation for honesty in his dealings with owners and other business connections, especially with reference to the quality of work performed—not that the awarding official is interested in his reputation merely as such, but that he may make up his mind whether the bidder, if awarded the contract, will comply therewith and deliver the quality of work for which he is to be paid. The fact does not seem to be generally recognized that no amount of supervision and inspection can force an honest job out of a dishonest contractor, or a well-constructed job out of a contractor who is incompetent. This second factor, like the bidder's skill, is not susceptible of accurate measurement, but a sound opinion can be formed by awarding officials through the exchange of information with owners, engineers, architects, surety companies and others with whom the bidder has had dealings.

The third factor of qualifying, and the only one of the three on which the bidder can be accurately gauged, is financial ability. The measurement of a business man's responsibility by means of his financial statement is a process dating from time immemorial. It is used or presumed to be used in every important industry; though the construction industry and nearly everyone who deals with it, especially on public work, has largely ignored this important item and mostly because of a misconception of what constitutes the lowest responsible bidder. A childish belief seems to have gained footing that any individual who can assemble a pile of equipment, buy material on credit and produce a surety bond, is competent to receive an important contract.

Essentials of Financial Responsibility

The plain facts in the case of the average type of bidder, as revealed by the records of construction companies, are that unless the bidder owns his equipment outright, has a reasonable amount of cash and a contract price representing a reasonable profit, he is doomed to failure on any sizeable job as soon as he signs on the dotted line. For every kind of construction and every set of conditions, there is a ratio of liquid assets to volume of work under contract, which cannot be exceeded. So far no one knows exactly what these ratios are, but they are receiving study from both engineers and contractors. Eventually this study will produce some recommendations which will be invaluable, not only to awarding officials, but also to the contractors themselves.

Equipment and organization are of course important factors, but for purposes of this discussion they may be considered as elements of financial resource. If the bidder has sufficient financial backing to

purchase equipment and pay for a proper organization, it is probably safe to assume that he can secure them.

In exercising judgment, it is obviously necessary for an awarding official to consider not only whether the individual project is too big for the bidder to handle, but also whether in the sum total of his operations he has become over-extended. This common ailment of over-extension has probably caused more defaults than all other causes combined; and responsible contractors, both large and small, are fast appreciating the necessity of keeping within their proper limitations. However, it should be emphasized that the term "responsible contractor" has little reference to size, but indicates a contractor who can and will perform his contract and who maintains a proper balance between his resources and ability on one hand and the type and volume of his work on the other.

The responsible contractor has an investment in his business and a pride in his reputation as great as that of an engineer. Yet he sees contracts awarded to competitors who will default today and undermine him with dishonest competition in some other locality tomorrow. With each of these defaults, the responsible contractor sees public ill-will accumulate, not only against the irresponsible men, but against himself and his industry as a whole. These are some of the things that the engineer and the responsible contractor encounter as the result of conditions prevailing in the public construction field.

By pre-qualifying contractors, the responsibility is determined before the contractor receives the plans and submits his bid and then if any questions are raised, they can be decided.

One of the arguments against pre-qualification is that it will place too much

responsibility upon the awarding officials, but this is just where the responsibility should rest. The municipality looks to these officials to see that its interests are protected, that the work is properly done in accordance with the contract, and that the taxpayers receive full value for their money. Why, therefore, should not the awarding officials be permitted to determine who the lowest responsible bidder is? No competent official should object to assuming his proper responsibility under pre-qualification; otherwise the responsibility is often placed upon an irresponsible contractor, although the awarding officials must accept the criticisms.

It has also been said that pre-qualification opens the door for dishonesty in the awarding officials by means of favoritism, unfairness, etc. However, an official who will be dishonest can work to better advantage under the present method of awarding than he can under pre-qualification where he assumes the responsibility. No statute will make such an official honest, and the sooner he is discovered and discharged, the better.

Another argument against pre-qualification has been that it makes a close corporation for the contractors, stifles competition and prevents an ambitious young man from starting in business or becoming a bigger contractor. Nothing is further from the fact.

Competition Not Prevented

The only contractors eliminated are those who are the bane of our municipalities and responsible contractors today. It is almost impossible, regardless of the amount of supervision and inspection, to secure a proper grade of work from such contractors. Quite often, because of the contractor's financial limitations, laborers employed on the work are either hampered in securing their pay or unable to do so. Not only does a bad credit situation of this kind prove embarrassing to the municipality, but it is the cause of considerable delay in the work itself.

Instead of stifling competition and preventing a young man from starting in business or becoming a bigger contractor, pre-qualification provides the best possible safeguard for such a contractor. It permits a young man with experience and some financial backing to qualify for such work as he is in position to handle; and as his experience and qualifications increase, the size of the work which he can bid on will increase. Pre-qualification protects him, not only from irresponsible contractors, but also from himself in over-expansion, and acts with the contractors as the Federal Reserve Bank does with the financial institutions—a balancing factor. Any contractor who believes himself discriminated against still has the right of a review and his day in court to prove his contentions.—*Associated Contractors.*

OLD HOMES MADE NEW

In every community there are many houses that are far removed from the present standards of architecture, construction and convenience. In fact, authorities estimate that there are approximately 12,000,000 such old houses which can be profitably modernized. When this is done, they are worthwhile old homes made *new*. One of these residences may be yours to make more desirable and comfortable for its occupants.

A home is, indeed, an investment which from the practical measurements of dollars and cents must not be allowed to deteriorate. Evidence of this is seen in the fact that home owners everywhere are finding it profitable to modernize their old properties. And because remodeling means always a greater resale value, it may even be considered as a form of insurance which the householder should carry to protect his family in event of any contingency that may force the sale of the house.

Modernizing Increases Property Values

This home modernization movement likewise offers an opportunity to beautify and develop residential communities. It also serves to attract other prospective home builders, thus increasing property values generally, with resultant benefits to the entire community. Modernizing any house is ultimately a community as well as a personal affair.

Ordinarily it is an easy matter to finance alterations, inside and out, because they usually increase the value of the house more than their cost. Here is what actually happened in Washington, D. C., when an old house was modernized: Although the mortgage company rated the house as absolutely valueless, the lot was appraised at \$5,000. The company, however, extended loans up to \$9,000 for carrying out the work of alteration. When the changes and additions were made, the house and lot were valued at \$14,000, and considered splendid security for the \$9,000 loan. The company explained further that the property now has a cumulative value which will amount in the near future to \$18,000—due entirely to the effect of the renovations. This is but one example; doubtless home owners in every community have had similar experiences.

It pays—from every human standpoint—to modernize the home. Thousands and thousands of homeowners have found modernizing to be a simple procedure, quickly accomplished, easily financed. They have found that modernizing pays, not only in money values, but in those equally important but intangible benefits—happiness, pride, social position, comfort, convenience, beauty, all the large and small factors which make home life worthwhile.

Concrete and Modernization

What of the materials used in modern-

ization? No matter what the size of the structure to be modernized, concrete finds a wide range of usefulness for making improvements that enhance the beauty and increase the utility and value of the property. The more strictly utilitarian uses of concrete include footings, foundations, floors, plaster, stucco, roofs, chimneys, fireplaces, walks, drives, garages, alley pavements and other home improvements that will increase the utility as well as the beauty of the property. Then there are numerous ways in which concrete may be employed to give a decorative touch to the home and its surroundings. In this group are lawn benches, bird baths, sun dials, flagstone walks, lily pools, flower beds, flower boxes, arbors, garden walls and other similar uses.

Concrete not only is structurally permanent, but its beauty and its character are enduring as well. Old houses, resurfaced with portland cement stucco, colored and textured, possess a built-in beauty. Stucco is but one of the concrete improvements it is possible to make when obtaining *new* homes from *old* houses.

Economy of Concrete Improvements

Along with their advantages of permanence and beauty, improvements made with concrete are decidedly economical. And when built, concrete improvements last, since concrete is a material which is durable, firesafe, rotproof and maintenance-free.

Some houses need only a few touches here and there to bring them up to date; others require more. It is astonishing what a decided difference a few slight changes make. The alteration of a front entrance or a porch—an old porch converted into a pleasant sun room—an old exterior made modern with portland cement stucco—a ramshackle roof made attractive and firesafe with concrete roofing tile or cement-asbestos shingles. Each dwelling presents its own separate problems and the modernization possibilities should be considered individually. Much or little modernizing can be done to suit the tastes and the pocketbook.

There is this to consider always in modernizing. When rebuilding or renovating, it is best to make permanent improvements. For modernization, to be real, must involve attention to fundamentals. Foundations, basement floors, bearing walls, fire-stops, footings for foundations—these and other more or less hidden elements must be considered before the final and apparent changes are undertaken. The best policy is—build soundly within and without. Judicious use of concrete and concrete products, it has been found, makes possible modernization on a sound structural basis, thereby eliminating the speculative element in the modernized house market.—*Associated Contractor.*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

**This Stucco House Can
Never Leak or Crack**
*It's Hardened and Waterproofed with
"ANTI-HYDRO"*

121 OAKLEY RESIDENCE, SAN BERNARDINO, CAL.
HOWARD E. JONES, ARCHT.-CHARLES SCHMIDT, CONTR.

In order to permanently preserve the beauty of this house and insure a dry interior, the stucco was hardened and waterproofed with "ANTI-HYDRO". It cannot leak, and the stucco is so hard, it will never crack or chip.

In addition to its hardening and waterproofing qualities, "ANTI-HYDRO" has many other advantages. It so enriches the mixture that the mortar sticks firmly to walls and prevents sliding, so that workmen can plaster 50% more surface in the same time as when using plain cement mortar. It insures a perfect bond to tile, brick or concrete. And any tone may be obtained by adding dry mortar color. "ANTI-HYDRO" may also be used with white cement and white sand without dimming or changing the color.

"ANTI-HYDRO" is a liquid integral compound and therefore easy to use. It mixes readily with the water used to wet down stucco. For 25 years it has been the outstanding concrete hardener and water-proofer. Results are guaranteed permanent. Use it on your next job.

MEETING THE ARCHITECT HALF WAY

Advantages of Architect-Builder Corporation Told in Interview with

L. V. Boyd

By L. K. DAVIS

"Cannot builders and architects share each other's problems in a manner that will benefit both?" I asked Architect Lawrence Visscher Boyd as my first question when seated in his office.

"If not, why not,—and what's to be

done about it?"

Without giving him a chance to reply, I went on to present the other questions I had made up as a result of my talks with builders. They were:

"Does the architect 'high hat' the man who works from the plans and specifications?"

"Is the average builder too much tempted 'to go on his own' in matters of design?"

"Is the average architect often impractical to a degree that causes unnecessary structural complications?"

"Is architectural superintendence often an irritation instead of an aid?"

"And lastly, is the architect's service free, particularly on small work, sometimes an excess cost which owners should not be asked to add to their other costs?"

He hesitated a moment as a result of this avalanche of questions, then replied.

"The first two questions cover most of your points," he said with a smile. "I'm glad you've asked them. Let me tell you why I believe there should be the closest sort of relations between architects and builders."

"An owner employs an architect with several definite things in view. He wants a building that, first of all, is right in its design. He wants its plan to meet special requirements. That settled, he wants the final costs to be reasonably close to a price he has decided he shall pay."

Cooperation is Essential

"If the architect is experienced in designing and following construction progress of the type of work for which he has been selected, the first important step has been made toward cooperation of the kind we're discussing. Architecture has become a highly specialized profession. There's architecture of distinctly city type, industrial architecture, institutional architecture, country and suburban architecture. Each is a subject in itself and has closely grouped problems of design and construction. When owners appreciate this fact more fully, perfect coordination between the architect and builder ought to follow as a matter of course."

"The architect who gets into a field filled with structural problems that are entirely different from those in which he is well versed is apt to have difficulty in working closely as he should with the man who follows his plans and specifications. I believe that most failures in architect and builder co-operation could be traced to this as their main cause."

"Among the dozens of builders with whom I have worked, I cannot remember one who was not glad to have an experienced architect associated with his efforts from start to finish of the job. When I say 'start and finish,' I mean exactly that; and by 'start' I mean the very start, the time at which an architect has his designs

in more or less preliminary form, and not at the final stage when plans and specifications are ready for an iron-clad estimate.

"In my own case, I learned early the value of going over the problems of structural as well as owner requirements with the men who later would be asked for bids. Many a time this has been done before even the rough sketches were submitted to the owner. It is surprising how many variations may come about during such discussions, particularly as affecting costs. Invariably they serve to work out economies in material and labor, and settle many questions which otherwise would become real difficulties with the work under way.

"The proper development of plans and specifications before actual estimates are required removes a lot of guesswork from a builder's calculations. It is almost sure to result in freedom from arbitrary demands, vague specification clauses and ambiguous statements which can cause so many troubles for everyone concerned.

"Once an architect and builder begin in this way, the most thorough kind of co-operation usually follows through each structural phase to final completion. Circumstances often arise in which the co-operative suggestions of the architect result in changes, sometimes on large scale, from which the owner receives more for his money than was originally contemplated. Many of these I have built into a permanent record, making them part of specifications used for the type of work on which they were first tried out.

How Architect Helped

"I have in mind one instance where an owner desired a beamed ceiling for his library after work had begun. The extra cost of planed and painted material for this unforeseen change raised immediate objection.

"Between us, the builder and I worked out the effect desired without increase of cost—rough but true hemlock joists of the second floor left exposed, block-bridged, and colored tobacco brown by shingle stain!

"In another home of my design, a country home, the owner suddenly longed for wrought-iron latches and hinges on interior doors. That, too, raised a question of considerable extra cost.

"The builder and I talked it over. Then at a local hardware store we bought, for 15 cents apiece, a few enamelled thumb-latches and hinges of the common stable door variety. These we tossed upon the red coals of a kitchen stove, turning them over every couple of minutes or so until the glistening black coatings had burned away. The result was an almost unbelievably decorative effect in richly mottled iron. So the owner had what he wished, at a mere fraction of the price we had feared.

Made Saving for Builder

"Working closely with the builders, sharing their problems, has brought forth many structural efficiencies which without mutual co-operation would never have been realized, certainly not if superintendence had been made from a strictly architectural point of view.

"On such a simple interior accessory as baseboards, for example, builders and I have often repeated substantial reduction of material cost by using 5-inch instead of 10-inch boards. Those of one-half the usual specifications height serve their purpose perfectly and add, besides, a decided impression of greater-than-actual area in small rooms.

An Idea for Brick Laying

"New ways and means are constantly suggesting themselves to the architect who stays in close touch with the contractor. Years ago a builder and I discovered a way to lay the brickwork of hearths, porches, terraces and walks, which I have since always advised for work of this character. A base of rough concrete is first prepared. Over this is spread an even bone dry mix of equal parts portland cement and sand, one inch in depth. The bricks are placed and tamped solidly. Then the entire surface is soaked to full absorption from the fine sprinkler nozzle of a hose. The water, of course, goes through the joint spaces, which should be kept open and free from cement and sand, to the dry mix. This forms a solid bond on the bottom and well up the sides of each brick, holding with a grip which defies disruption by time or weather. A further advantage in this method is the absence of surface staining.

"Another effective method which I have learned from builder associations is the easy and economical damp-proofing

of exterior walls of brick or stone. Many a dollar has been spent by owners in trying to overcome the effects of moisture which, through capillarity, has climbed a wall from damp ground below the grade line. I have known many a splendid piece of stucco to require expensive repair or replacement because of repeated saturation by water that has risen ten and more feet above the foundations.

Finding Short Cuts

"In all work where there is even a remote risk of this occurring, I find contractors are only too glad to fall in with my suggestions that a course of roofing slate, edge butted to edge, be laid across the thickness of the exterior wall at a height of 6 inches above grade line. And I have yet to see the method fail.

"In many buildings where strict economy must govern the use of material, numbers of 'dodges' and 'short cuts' advised by the structurally minded architect may aid in gaining maximum effect at little cost. A striking example of this happened on one development for which I had been employed as supervising architect.

Improved Trusses

"For economy's sake, but with some misgivings, 3-inch floor joists had been specified instead of heavier material. These gave the floor centers of some of the larger rooms a most annoying 'spring'. The builder and I racked our brains for a remedy which would not pile up extras. Finally we hit on one that made these floors as rigid as concrete.

" $\frac{7}{8}$ -inch x 3-inch strips were cut from waste lumber. Two of these were used to a joist, nailed diagonally across one side from opposite ends and meeting at a carefully mitered angle below the top of the joist exactly in the center of the span. These improvised trusses took up the

thrust from the floor above and gave all the strength and stiffness of the heavier material, minus its added cost.

"The list of efficiencies made possible by thoroughgoing cooperation, you see, could be a long one. In it would be a great variety of worthwhile items, ranging possibly from extra chimney flues with paddle dampers for the elimination of kitchen heat and odors, to 'trapdoor-ing' library floors beside fireplaces with almost invisible bevel-edged hatches matching the floor boards, providing quick access to firewood kept ready for use on a stage of scantlings a foot or so below floor level.

"The few examples I have cited from many in my files have, I hope, shown how well cooperation between architect and builder can be made to pay in better structural results for the owner. There seems to be every indication that architecture and building are warming up to the necessity for closer, more personal, more active union of viewpoints as they affect design and construction problems.

"Architecture, building, allied trades and crafts, are not independent elements as some of us have come to believe. They should function together through intimate man-to-man contacts which, as I have found in my own experiences, must begin at the beginning and remain close-meshed until the owner takes possession. When this becomes more general, architects and builders will realize how much one depends upon the other."

In addition to the helpful suggestions made by Architect Boyd, we may well consider for a moment ways and means now being practised in many parts of the country to bring about better feeling between the architect and the builder.

One of the outstanding examples is the New York Building Congress where representatives of the entire building industry cooperate in bringing about reforms in which all are interested. Monthly luncheons are held in which a speaker, whether architect, builder or engineer, discusses some problem of mutual interest. The contacts established at these meetings do much to help the various elements in the building business to get an understanding of each other's point of view.

After all, it is very apparent that no architect worth his salt has any desire to make the contractor lose money; it is, rather, to his best interest to maintain a friendly feeling with the builder. On the other hand, no intelligent contractor or sub-contractor can ignore the valuable information and help which he may obtain through contact with an architect.

Getting the Men Together

One very helpful suggestion that has been offered is that local builders' exchanges and other contractor-builder organizations make an effort to get in touch with architects in their communities. It is suggested that letters be written to the secretary of the local chapter of the American Institute of Architects or to leading architects, inviting them to attend luncheons or evening meetings of the builders. In return, representatives of the contractors' organization would be invited to attend meetings of the architects and the viewpoints of both groups could be exchanged.—*Building Age*.

Abstract of speech of F. H. Frankland, Manager of Technical Service, American Institute of Steel Construction, Inc., New York, at the first annual convention of the airport section of the Aeronautical

Chamber of Commerce of America, Inc., meeting at the Hotel Cleveland, Cleveland, Ohio.

It has been pointed out that foresight in the building of rail terminals would have saved the railroad companies tremendous sums which they have spent in recent years in scrapping the old and building anew. As airports are essential to air transportation, the necessary knowledge concerning them is being acquired largely by experience, and a thorough understanding of the principles of obsolescence should be had by those concerned with the development of airport layout and construction.

The Department of Commerce reports that at the end of 1928 there were 921 proposed airports, an increase of 449 over the previous year, and estimates that there were in existence, January 1, 1929, 1,324 airports and landing fields in the United States, comprising 368 municipal fields, 365 commercial, 321 auxiliary, 197 intermediate, 64 Army, 16 Navy, 1 for the Department of Agriculture and one for the Department of the Interior. At the end of March last there were over a thousand cities and towns undertaking the construction of airports, and it is stated that another thousand towns have laid plans out of which aerial terminal facilities will emerge. It is estimated that the next year and half will see \$500,000,000 expended in such construction, about \$300,000,000 of which will be spent in 1929. In the eighteen-month period ending January 1st last, \$300,000,000 was spent to provide such facilities. From this it will be readily seen that the industry is yet going through the growing pains of development, so the permanence of existing airport locations and facilities may be questionable, and this factor should have careful consideration in selecting the type of construction for the various buildings. It was found necessary to completely scrap a \$600,000 investment in inadequate airport structures at the Croydon Airport, at London, and invest \$1,000,000 in more suitable structures.

It cannot be stressed too strongly that the future of aviation rests on the ground, as it is there that planes must take off and land. Foresight in construction will save millions of dollars in the near future.

It is essential that no part of a hangar structure interfere with the free and rapid movement of aircraft, and that all of its floor space is usable and that it contain the minimum cubic content per plane unit of capacity. These objectives can only be efficiently obtained by a properly shaped floor area, vertical sidewalls of minimum height and trusses having horizontal lower chords. It is evident that an arched roof construction having its springline near the ground level will materially reduce the usable floor area and enclose unnecessary space.

From present indications, planes of the future will, for the most part, be trimotored machines, with a large passenger and express carrying capacity; therefore consideration must be given to hangars with sufficient storage capacity and terminal buildings providing adequate facilities so as to earn a profitable income on increased land values and other unforeseen causes. If an airport is abandoned because of obsolescence or if the steel frame airport structure for any reason becomes unsuitable it can be disassembled and re-erected on another site, or the steel frame removed and re-erected or adapted for use as an industrial or storage building. Its usefulness and value are permanent.

The articulated or "jointed" steel frame is susceptible for quick and inexpensive alterations and reinforcing and can be readily adapted, with safety and minimum expense, to the enlargement or rearrangement of the building. Should the demand for hangar space increase beyond the existing capacity, a steel frame floor of sufficient strength and supported by widely-spaced columns can be built under the trusses and the trusses raised sufficiently for a second story and then be attached to new steel columns. With an inclined steel frame ramp to a wide platform built along the front, the upper floor could be used for large planes and the ground floor for smaller aircraft, or for repair shops and storage, as has been so successfully accomplished at the great Littorio Airport in Rome.

The world's largest hangar is now under construction at Akron, Ohio, by the Goodyear-Zeppelin Corporation, to house the two gigantic airships to be constructed by that company for the United States Navy. This steel frame structure will be 1,200 ft. long, 360 ft. wide and 200 ft. high and will have an unobstructed floor area of 389,000 square feet. The doors, each weighing 800 tons, are unusual in design, running on 40 wheels when opening and closing. This steel frame hangar will be covered with asbestos protected Steel Sheets with trough Stiffeners — there being approximately 1,200,000 square feet of this covering material required.

As illustrating the type of hangar adopted by the United States Navy to house its kite balloons, may be cited the steel frame structures designed and built by the Navy at sites which it is not permitted to name. The Navy has standardized on an all-steel type of hangar for its seaplanes, with flat roof and horizontal bottom-chord steel trusses, steel columns and girts. An officer of the Air Corps, United States Army, says:

"There are in general three types of material that can be used: wood, concrete and structural steel. The first should be eliminated on account of fire hazard. Our available information and check of construction costs indicate that a concrete hangar will cost more than the same capacity structural steel building. The most practical type of concrete hangar is the parabolic shape. This means to get the necessary 110x20 foot cross-section that there will be a lot of waste space in the structure which is poor practice from a heating point of view if no other.

"We concentrated our efforts on the structural steel type of hangar which I believe, taking all conditions into consideration, is the most satisfactory."

The Oakland Airport in California furnishes an example of one of the most up-to-date and approved types of hangars, all steel framed. The development calls for the construction of four hangars in the first unit to be built. Number 3 and Number 4 hangars were made larger in order to keep pace with airplane development. The newer hangars have 120 foot clear openings to accommodate the largest existing commercial planes, while the earlier hangars provide for planes having less than 90 foot wing spread.

Columbus, Ohio, is expending \$850,000 for the construction of its municipal airport, which will provide for a steel framed administration and passenger terminal building, with waiting and rest rooms, a restaurant, ticket offices, etc., on the first floor, and offices for field administration, rest rooms for pilots and space for air transportation companies on the second floor. A tower is to be extended above the second floor in which will be housed

the controls for field lighting and facilities for weather observation.

At the Tulsa Air Terminal, Oklahoma, will be built, for present needs, three steel-framed structures, the central one to be known as the Midway Building, providing terminal facilities, such as ticket offices, waiting rooms, baggage rooms, a restaurant and a roof garden, as well as a large hangar unit. The other hangars of similar size and layout will flank the terminal building for the present. Eventually all of the land surrounding the large landing field will be utilized for hangars and other steel frame structures of similar appearance.

As indicating the trend of design for hangar structures capable of taking care of future increase in wing spread of planes and for providing ease of access for planes entering and leaving, the steel-framed hangar at the Ford Airport, Dearborn, Michigan, provides a clear unobstructed door opening, on each side, of 300 feet long by 20 feet high.

It is obvious to all that aviation is destined to exert a tremendous influence on civilization. Each day the public are becoming more air-minded, and the industry is moving forward with speed which is absolutely unparalleled or even approached by the development of any other industry in the world's history, and if this development is to remain unchecked the greatest care and foresight must be used in providing proper and adequate facilities at airports, which will be capable, as far as possible, of providing for developments in the industry both seen and unseen.

TO THE BUILDING PUBLIC

Two Assumptions

Correct relations are the bases of social and economic welfare.

On the structural frame hang all of the building and its contents.

The Structural Frame

Structural frames for buildings must have two principal qualities. First, adequate strength to perform its work; and, second, its cost to be economical and correctly proportionate to the total cost of the building.

Adequate Strength

The science of structural engineering has been developed progressively from certain basic engineering data as new demands have been made. The structural materials have been improved steadily both in quality and shapes. In fact, this science of engineering designing and the production of suitable materials have never failed to satisfy every demand. When we compare the building industry of today with that of scarcely a half-century ago, we have a conception of its tremendous growth. This growth of the building industry would not have been possible except for the facilities and the security provided by structural engineering and the steadily improved processes of manufacturing structural materials.

With very few exceptions adequate strength has been the uniform characteristic of structural frames in buildings. The limited number of building failures can be segregated into two groups. The collapse of trusses or other framed construction is often the result of the primary failure of related parts such as masonry walls, piers and foundations, of which the design and supervision of construction is very often under the control of others than the structural engineer.

In the few instances of the failure of structural frames they are found to be caused by incorrect designing, inferior material or improper workmanship. To the credit of the structural engineer, it is found that incorrect designing is an extremely rare cause of failure.

Adequate strength of the structural frame is secured by the employment of competent structural engineers to prepare the plans, inspect the fabrication and supervise the erection.

The appreciation of the essentials of the adequate strength of structural frames by governmental units is indicated by the requirements of building codes and the examination of structural engineering designs by the building departments. These are legal measures intended to safeguard the occupants of buildings from injury or death primarily, and, secondarily, to insure the building investment.

The effectiveness of building code regulations and building department examinations is often limited for obvious reasons but such procedures do emphasize the importance of and necessity for correct structural engineering service.

Economical Design

The designing of a structural frame so as to secure the maximum economy in cost is important. There is a definite and proper relation between the cost of the structural frame and the total cost of the building. These comparative costs vary with the type and kind of the structure.

To secure profitable building investment it is essential that there exists the correct balance of the cost of the structural frame and the total cost of the build-

ing. A design may provide for barely sufficient strength and still be uneconomical in cost of construction, or it may provide for excess strength. These conditions result from incompetent engineering service.

Economical designing is not attained merely by employing the established rules of structural engineering but rather by a broad knowledge of the science as it relates to building construction in general and a judgment of values which is the result of experience and observation.

A General Opinion

Too often, the architect, the building owner and the builder fail to realize the value of competent structural engineering service. They do not realize the tremendous development of the art of building. There are structural engineers now in active practice who have witnessed the entire development of modern building construction—greater than in the entire previous history of the world—the beginning of which was coincident with the production of structural steel as a commercial commodity.

There is, however, a growing appreciation of the necessity of competent service, both engineering and architectural. There are vast sums of money invested in buildings which do not earn a profitable income. These unprofitable investments are the result of several conditions such as improper site; wrong type of building for the site; and, very often, incompetent engineering and architectural service.

To insure profitable building investments, the intelligent and conservative owner, mortgage-bond banker and the purchaser of building securities, are giving increasing attention to the qualifications of the engineer and the architect employed to prepare the designs and specifications.

There are, however, many owners and investment bankers, as well as architects, who do not realize the importance of competent structural engineering service. It is often considered sufficient if the structural plans merely pass the plan examiner at the city hall. To secure such plans at the lowest cost possible appears to them as a good investment and an indication of shrewdness in bargaining for service.

A design that will barely pass the plan examiner at the city hall and thus become legal, fulfills only the minimum requirements for strength. Even then it may develop inherent weakness when exposed to unexpected conditions which are quite common in the life of buildings, and it may be uneconomical in the cost of material and its fabrication and erection.

There is a correct relation between the required strength of the structural frame, the volume of the material required, its method of fabrication and installation which produces the maximum economy.

All of these factors must be studied relatively and coordinated correctly. Such a service is valuable and is rendered only by the competent, experienced structural engineer. It cannot be secured at a reduced professional fee any more than competent medical, surgical, legal or architectural service can be secured in such a manner.

Competent structural engineering service adds to the real value of the building because it is adequate in the assurance of strength and economy. The prestige of the architect, and very often of the contractor, is an appreciable factor in the evaluation of a building and to this the competent structural engineer makes a real and tangible contribution, although, unfortunately, it is not generally recognized.

GOOD ARCHITECTURE INCREASES VALUE

Good architecture has a very definite sales value. The well designed house will always sell for more than its less attractive neighbor, even though the floor plan and cost of construction be the same. Likewise, the business building that radiates style will enjoy higher rentals and a consequent greater return on the investment than will one which shows poor taste.

Take two pups, one a thoroughbred, the other a cur. At the end of six months, the cost of feeding has been the same. The cur is probably loved just as much as the thoroughbred, but what difference in their sales value! And what a difference in the pride of possession!

The automobile manufacturers have learned that lesson. Of two makes of cars, of equal mechanical excellence, the better looking is the better seller, every time.

Shops that cater to a class of exclusive trade have learned the cash value of good architecture. Without a setting of distinction, their prices would drop. That is why manufacturers of cosmetics, candy, even food products spend their good money for well designed containers. They have learned through highly competitive selling that the better looking or more convenient the package, the easier the selling.

Women have learned that lesson through the centuries. The better their style the greater their fascination. And since women are very largely the final influence in the purchase of a home, their natural appreciation of style makes them particularly susceptible to a house that possesses the enviable distinction of that kind of style which is termed "good architecture."

All of which leads to the inevitable conclusion that good construction and equipment, *plus* good architecture is the answer to "jerry-built" competition.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

**This Stucco House Can
Never Leak or Crack**
*It's Hardened and Waterproofed with
"ANTI-HYDRO"*

In order to permanently preserve the beauty of this house and insure a dry interior, the stucco was hardened and waterproofed with "ANTI-HYDRO". It cannot leak, and the stucco is so hard; it will never crack or chip.

In addition to its hardening and waterproofing qualities, "ANTI-HYDRO" has many other advantages. It so enriches the mixture that the mortar sticks firmly to walls and prevents sliding, so that workmen can plaster 50% more surface in the same time as when using plain cement mortar. It insures a perfect bond to tile, brick or concrete. And any tone may be obtained by adding dry mortar color. "ANTI-HYDRO" may also be used with white cement and white sand without dimming or changing the color.

"ANTI-HYDRO" is a liquid integral compound and therefore easy to use. It mixes readily with the water used to wet down stucco. For 25 years it has been the outstanding concrete hardener and water-proofer. Results are guaranteed permanent. Use it on your next job.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

Mr. M. J. French, formerly with Franklin M. Harris & Co., Builders, is now with Bowden Construction Company, Builders, 1607 Summer Street, Philadelphia.

Karl F. Otto, Architect, formerly of 1828 Arch Street, Philadelphia, announces the removal of his offices to the Uptown Theatre Building, 2240 North Broad Street, Philadelphia. Phone, Columbia 3060.

The volume of construction job activities during July declined both from the previous month and from the index level of the same month last year according to a statistical study just completed by the Associated General Contractors of America. This is interpreted as an indication that the rate of activities on projects under way, as measured by volume of shipments of construction materials, is beginning to reflect the decline in the volume of contract awards which has been in evidence during most of this year.

The index figure for job activities during July was found to be 218 as compared with 231 in June and 238 in July last year. Despite this recent reduction in activities as compared with the records of similar months in past years the construction performance for the first seven months of 1929 approximately equaled that of the same period in 1928.

This is explained by the activities on uncompleted projects for which contracts were awarded last year. The heavy volume of carried over commitments began to be cleared up in May this year and current activities are proceeding at the new levels dictated by the lower volume of contract awards.

The situation is not deemed critical by the contractor's association since most of the decline has occurred in the speculative type of residential construction, which is declared to have been proceeding at an inflated rate in previous years. Recession in this type of building is deemed to be beneficial and it is anticipated that once the flow of funds turns from the stock market to other channels that sound investment construction will again proceed.

THE GENERAL CONTRACTOR AND THE "SUB"

By H. P. BURRELL, Chief Engineer,
MacArthur Concrete Pile Corporation

On important construction work, sub-contractors are generally specialists, and more and more they have become experienced, reliable experts, authoritative in their own fields, and provided with adequate organization and equipment.

The relationship between such men and the general contractors is substantially the same as that between the general contractor and the owner, in so far as the execution of, and payment for, the work is concerned, and as to the obligations, amenities and ethics involved.

Except under special conditions there should be no direct financial relations between sub-contractor and owner, archi-

tect, or engineer. Unless the architect or engineer has some special reason and wishes to put his own inspector on the work, the general contractor's superintendent or inspector should direct, examine and approve or reject all work and operations. Sometimes municipal inspectors are assigned to the work, with the arrangement that they are to be paid by the sub-contractor, and such cases have proved honest and satisfactory.

Great Care Urged

The general contractor should exercise more scrupulous care, and make more rigid requirements in the selection of a sub-contractor than the owner does in the selection of the general contractor, both because the general contractor is responsible to the owner for the sub-contractor's work and because the general contractor is often anxious to get the sub-contractor's work done at the lowest possible price. If the price is too low to provide a fair profit, the subcontractor is inevitably disheartened and handicapped by lowered morale before the work is even commenced, and no matter how honest and competent he is, there is a strong, even if unconscious, temptation to take chances on labor and materials, to cut corners, and to unduly economize in many ways that can hardly be prevented, and which impair, even if they do not endanger the work.

On important work, the general contractor generally is assured of the integrity, experience, and financial ability of the sub-contractor, before awarding the work to him, and therefore seldom requires a bond, although one is sometimes paid for by the owner.

In our 18 years of business, we have been perfecting our specifications to cover every possible point without ambiguity, omission or contradiction.

All our work is done under our own

specifications that, in general, provide a lump sum price for the estimated unit quantities and fixed prices for possible changes in requirements, types or conditions, for increased or diminished quantities, extra work and materials, and especially for installation and organization charges if the work is stopped, and for all expenses caused by delays. All of these items should be covered before the contract is signed, so as to avoid delay and uncertainty as to the terms under which the work is to be done. This is not the case if these points are left undecided, until a contingency has arisen. Sometimes we arrange to use portions of the general contractor's equipment.

The sub-contractor often gives estimates on the same job to several competing general contractors before the general contract is awarded, and these estimates are usually identical as far as the conditions and requirements are the same, but may vary if different contractors have different working plans and schedules, or else do different portions of supplementary work themselves.

Careful study and coordination between general contractor and sub-contractor, before the former makes his bid, will generally be advantageous to both.

Sub-contractors should not enter into competition with general contractors by bidding on the whole of a large construction job in order to get their own special part of it; it is unfair, unnecessary and unprofitable in the long run. In general, the relations between general contractors and sub-contractors are harmonious and profitable, and unreliability and deliberate trickery are becoming more and more infrequent.

"Pernicious Practice"

I believe that some few general contractors have developed the pernicious practice of submitting bids, as for public

schools in New York, that are materially lower, often as much as 10 per cent. lower, than the sum of the estimates of sub-contractors previously invited by them. In case they receive the contract, they demand reductions of perhaps 15 per cent. in the sub-contractors' bid, and if they are not forthcoming, a search is made until reckless, incompetent or tricky sub-contractors are found to undertake the work below honest cost prices.

This, of course, insures bad results; puts a premium on poor work and material, discredits fair bids, demoralizes business and works great hardship and loss to competent, conscientious contractors and sub-contractors. Such practices should be most strenuously opposed and should debar their perpetrators from competitions.—*Associated Contractor.*

PROFIT IN CIVIC PRIDE

By James E. Serven

The people in your town—in every town—are developing a taste for better things. This demand is felt in all business but it has its most serious aspect to you and the one in which you are vitally interested in the way it will affect the future of your own locality. In the trend for better living standards there enters first that basic investment—real estate. Property values are determined by conditions which in most cases may be governed by the owners themselves. To keep pace with the modern ideas of value and desirability, each community is faced with the problem of maintaining and increasing its attractiveness to the outside world.

Generally, new business must be drawn from other sections which have less to offer in meeting the particular demands of those individuals who seek the change. The prospective newcomers may be grouped as to representative needs based also on the demands of those comprising the present population. Then an intelligent programme may be followed in providing these necessities.

In this article there are reviewed for you some of the methods employed by progressive communities—methods which returned a profit through increased value that many times repaid original expenditure and effort. There is probably no planning which will produce an ideal city, but foresight, vision and the employment of practical principles will go far in new towns and old towards increasing the civic pride and making the community a better place in which to do business and to live.

Tearing down buildings, the widening of streets, elimination of grades and changing of sewers, drains and other underground connections has constituted a large portion of waste in the general growth of our municipalities. In the future, this may be avoided to a much greater extent. Most of this waste could have been avoided by preparing comprehensive plans for the development of these cities. More and more City Planning Boards are being formed to study the present and future needs of their communities and to provide for them in a way that combines utility with beauty. The old theory was based on the belief that as long as a building or "improvement" served satisfactorily the purpose for which it was intended—then it had accomplished all that was desired. Today,

this is not enough. These things must be planned also for future needs; they must be pleasing to the eye, correct in design and in harmony with their general surroundings. They must be inviting in atmosphere, attractive in their treatments and in appropriate good taste.

Many of the communities which have won their popularity through united community planning and pride in their homes, businesses and industries have first centered their efforts on the transportation facilities, the depots, stations and highway approaches.

How Others Accomplish Results

There is an outstanding case of a small suburban town which for years had slumbered along content with moderate, uncontrolled development. A few young men of the modern school were attracted to this town and through their efforts, a business men's club was formed. This club met once each week for luncheon and soon there were introduced practical plans of civic improvement that long had been needed. One of the first things considered was the railroad station. This building had been erected years before, an architectural monstrosity, wholly inadequate for the service which was needed. It created a bad first impression of the town. A committee was formed and through its efforts the railroad finally agreed to contribute an equal share with the town in beautifying the station and adjoining park. This was done and an unbelievable transformation resulted. In the two years since this progressive civic movement was started, business property has doubled in value and many other general benefits have accrued from this awakening to cooperative effort.

Signs—Their Use and Abuse

One of the unsightly and ugly practices in a community is the promiscuous placing of signs, posters and billboards on its buildings, along its highways and everywhere an opportunity offers. In many cases, this is done with utter disregard for local interests. Ordinances have been passed against these methods in many towns and others will come to the realization that their best interests must be in some way protected and this evil prevented. There are types of signs which serve a definite purpose. These may be made attractive and decorative and should be kept in condition of good repair, as well as freshly painted. In Larchmont, New York, a very progressive realty board has solved the "For Sale" sign problem in an unusually satisfactory way. All new listings of houses to be sold are listed with the entire membership of this organization, and one standard sign is placed on the property. On all houses that are unoccupied, a small metal box is securely fastened to the front door frame casing. In this box is placed the front

door key of that particular house. Each member of the realty board has a master key which opens all the metal boxes and thus produces the necessary keys to the houses when visiting them with clients. Houses are kept locked and clean in this way, eliminating the waste of time in procuring keys or the risk involved in leaving the doors unlocked.

Value in Restrictions

Building codes and general restrictions may be made skillful instruments in designing high character developments. They are becoming more necessary and should be worked out by experts whose experience and ability will lay down a reasonable and workable plan, neither top-heavy nor full of loop-holes. Zoning according to business and residential development also should be studied in your plan of an improved community, for it means much in the determination of property values. Along these lines also comes the problem of providing definite regulations encouraging more attractive roadside refreshment stands, small real estate offices, and those other buildings of a comparatively temporary nature.

Landscaping is Important

The planting of trees as a civic undertaking tends to assure a greater future in natural beauty. These trees may be secured from the state nurseries at very moderate cost. In laying out new developments, there is a decided tendency towards getting away from the conventional "gridiron" street plan, toward laying out the streets with more graceful and interesting curves to follow the natural contour of the ground, after making a careful study of topographical conditions. This method makes the street suit the ground rather than the more expensive method which makes the ground fit the street.

A central building for civic activity, public offices, and fire and police departments is desirable under most conditions. This may be made to be a feature of the town in architectural beauty, and placed on ground that is appropriately landscaped to provide the proper setting.

It develops upon every property owner, every merchant, every citizen in his respective town to contribute towards a quality of design, construction and general planning that will raise the standards, attract outside interest, develop a desire for residence and business association, and thus bring the tax ratio to a minimum and the facilities and beauty to a maximum. Such pride is profitable.

—*Building Age.*

FUTURE BUILDING COSTS

Thousands of prospective builders, who have been waiting ever since the war period for construction costs to drop back to something approaching the pre-war

level, have been disappointed. Prices haven't dropped to any appreciable degree. Materials vary a little now and then but they hold up. Labor costs have increased all along the line.

Now in the offing is the 5-day week for the building trades. That means less production per week at the same cost as now. Less working hours at the same scale of wages.

It means that material prices will have to recede from their present standards if even the present cost level of our homes is to be maintained.

The chances are that ten years to come houses will cost considerably more than they do now.

For these reasons it behooves the present-day home builder to do the job well, and to do it soon. For other reasons of economy he should make certain that his home possesses those qualities of permanence that make for economy of upkeep and delay in deterioration.

Common brick homes are unsurpassed in durability. They require the minimum in repairs; they are cheaper to heat than any other; they retain their complexion without the aid of a paint brush; they cost less to insure, and they always have the highest resale value.

The average man builds but one house in a lifetime. He should make sure that it is well built, that the materials used are durable. Brick is all of that.

In every one of the older cities are fine old brick homes that attest this, monuments to the good judgment of the pioneer builders of the Colonial period.

You may not be interested in building a monument to yourself but you should be interested in seeing that a quarter century hence your house will sell for what it costs now.

Brick homes are scoring such records every day.—*Building Economy.*

COLLEGES EXPAND COURSE IN BUILDING VENTILATION

Air Conditioning Plays Important Role in Engineering Curriculums of Schools

Add to architecture and other building sciences, the fact that America's leading universities are developing more comprehensive courses in air conditioning and mechanical ventilation.

With the general public emphatically demanding controlled ventilation and artificial cooling of buildings, the big universities are endeavoring to keep pace with the trend of the times by training engineers who are experts on mechanical control of air for health and comfort.

Such schools as Harvard, Yale, Columbia, Michigan, Ohio State, Kentucky, Illinois, Purdue, Mass. Tech., and many others, have expanded their courses in ventilation and students specializing in these subjects have increased in number

tremendously, the engineering deans announce. Many of the municipal universities have incorporated a ventilation course in their curriculums and with the beginning of the fall term other schools will feature air conditioning as a part of the engineering work. Even high schools in some cities have started classes in ventilation. In Youngstown recently the science classes of the Woodrow Wilson Junior High were taken through the big steel plants there to study the ventilating systems and methods of artificially cooling steel workers.

During the late spring term, the Carnegie Institute of Technology in Pittsburgh started a new short course in fans which also was available to night students. Included in the outline of studies for the new course are properties of air and gases, methods of measuring pressure, methods of measuring air, types of fans, theory of fans and calculations of characteristics, fan testing, air ducts for ventilating and heating for forge shops, mine ventilation and other problems, fan designs and selection of fans for mine ventilation, forced and induced draft for furnaces and building ventilation.

The Mellon Institute of Pittsburgh recently completed extensive studies of the soot and smoke problem and methods of controlling and combating it. This research included a careful "dust count" to determine the amount of dirt floating around in the air and breathed daily by human beings. Colgate University recently completed a very unique laboratory in which any kind of air conditions wanted can be created by mechanical means. Although air conditions considered best for the health of white rats used in biological studies are maintained in this laboratory, the system for artificially producing weather conditions is available for ventilation students.

An air research laboratory for directing all kinds of studies on air conditions and the best methods to control them in buildings has been maintained for a number of years in the United States Bureau of Mines in Pittsburgh. The laboratory has been used for scientific work by students of the University of Pittsburgh and other prominent schools. The American Society of Heating and Ventilating Engineers contributes to the support of this laboratory.

The corporation that is not making a profit is a menace to a healthy continuation of business, declared Charles F. Abbott, Executive Director of the American Institute of Steel Construction, in an address before the Gray Iron Institute meeting at the Downtown Club. Mr. Abbott insisted that we have been giving more attention to volume and not enough to production costs, and if this continues

for long there will threaten an unusual number of failures.

He said in substance:

President Hoover's report on Recent Economic Changes contains a most significant chapter on price movements. It needs no great amount of acumen to read between these lines. Most of industry's difficulties have been caused by the existence of excess productive capacity over current demand and without the means of obtaining any relief. Changed ratios between supply and consumption are prevalent in all important industries throughout the world.

Extreme pressure to obtain business has resulted in general price cutting reaching a point where only a relatively few most efficient plants earn a reasonable profit and even their margin has been seriously jeopardized as the result of unrestricted competition. Such conditions will not permit a definite price policy. Buyers know that inside prices are obtained under sufficient pressure, and all confidence in the sellers and all consideration of quality and service are dissipated, and the market degenerates into a price cutting orgy.

Many concerns gain the reputation of trading for every order and consequently salesmanship becomes utterly demoralized. I wonder if any of them realize what such tactics means in actual dollars and cents. Unless a cut of 10 per cent. in the price brings in a 50 per cent. increase in business you will not break even. In other words it is necessary to do half again as much business in order to equal the profit on the former volume at the former price.

A 5 percent. cut requires 18 2/3 percent. more volume.

An 8 percent cut. requires 35 1/8 percent more volume.

A 10 percent cut requires 50 percent. more volume.

A 12 1/2 percent cut requires 75 percent. more volume.

And a 15 percent. cut requires 112 1/2 percent. more volume.

Putting it still another way, if the price on a \$100 sale is cut 15 percent. it is necessary to sell \$112.50 more or a total of \$212.50 in order to receive the same total profit that would have been made on the \$100 sale at the former price.

It is axiomatic that under highly competitive conditions there comes a time when the margin between irreducible costs and profits with the most efficiently operated concerns finally narrows to the point where prices will not recede further. Profits become zero, and industry must learn that a million times nothing is still nothing. No amount of new business will then restore a semblance of profit.

The man who loses his mental balance is soon placed where he can do no harm to himself or to others. But when a man

loses his business balance and cuts his prices below the profit line, his contemporaries must suffer until economic death stops his unfair competition. There is only one way to sure success: sales prices must be established upon a formula of total cost plus profit. I offer you this outline for a courageous business policy:

1. Modern methods of estimating costs.

2. Modern equipment and efficient operation.

3. Statistics of production shipments and capacities compiled at a central source.

4. The declaration of a definite price policy.

Application of the sound principles of cost accounting constitutes one of the best guarantees of continued prosperity. Disregard of these principles is a form of business suicide. It is axiomatic throughout the commercial and industrial world that every business transaction should be based upon the fundamental formula of cost plus a legitimate profit. Orders taken at cost, or less than cost, lead to the door of the auctioneer.

There may be occasions when it is necessary to accept business at cost, but such occasions should be exceptional. When the necessity arises, the possession of an accurate knowledge of costs will make possible a complete realization of the exact risks involved. The point is to know the costs, and to act upon this knowledge rather than upon guess-work. In the overwhelming majority of cases, business would be rejected if the figures made it clear that the price was only equal to, or less than, the costs of production.

The application of a uniform system of cost accounting throughout industry would be a progressive step toward consistent prosperity. There is no need for any cost figures when selling prices are to be fixed by a system of outguessing competition. The principal purpose of obtaining accurate costs is to establish a base upon which profits may be added. The sum total then becomes the sales price. This method eliminates all consideration of what competition may do and is the only process that can insure successful operation.

As long as selfishness, personal animosities, jealousies and hatreds exist, intelligent practice will give way to a fight to obtain the business no matter what the consequences may be. It is a case of shooting wildly into the air, trusting to chance that an order may be taken away from some competitor even though he may be entitled to it.

The acceptance of more constructive methods is essential before there can be any need for cost prices. Eventually this need will become recognized. Profits will then become the incentive with less consideration devoted in trying to guess what price competition may quote. The

use of accurate costs advances intelligent competition. Inaccurate costs, obsolete equipment or inefficiency in operation develops the ignorant destructive form of competition from which the best organized concerns become infected whenever ignorance prevails.

The practical approach to the problem rests in education, to bring about a complete recognition of the vital need for profits which become possible only when all members of an industry accept and apply the only possible means by which profits can be obtained. This method calls for control to be vested in costs upon which selling prices will be based.

The plants operating on the basis of the highest efficiency are the most forceful advocates of distributing intelligent cost data and the collection of statistics realizing that their participation serves as the most effective means of influencing others, who may be operating ill-advisedly, from weakening the market or indulging in destructive competition.

No more important undertaking awaits the attention of industry than these factors to promote uniform cost accounting. The pursuance of such an activity would prove to be the transitory period from that of a constant lowering of the price structure to a resumption of selling prices based upon costs plus profit.

Unfortunately, in face of the high record in active demand for goods, prices and profits have not as a rule followed the economic law that normally calls for improvement as demand increases. The problem in nearly all industries is not a lack of business, but the failure to maintain prices that include a reasonable profit. Business men are now called upon to blaze a new trail.

The shifting in economic factors during the past few years has brought about unusual conditions. New problems have been created that have called for co-operative organizations in order that the interests of each industry might be safeguarded. It has been a trying period that has forced programs of standardization, elimination of waste, efficient production, cost reductions and aggressive salesmanship and advertising. Those who have heeded the signs of the times have profits, while those who have hesitated are experiencing the ill effects of these new economic conditions.

Mr. Hoover's committee points out bluntly that wholesale prices have been declining during the past seven years, and this in the face of a rising tide of business and personal prosperity for labor. If there is any tendency toward a greater stability of prices, however, it must come from the more general recognition on the part of business men individually and collectively that there is a greater need today than ever before for knowing accurately their costs and their right to expect a reasonable profit.

"ANTI-HYDRO" Plaster Coat Waterproofed Leaky Walls and Pits in this Post Office

The concrete pits and the walls of the pipe tunnels in this post office leaked badly. A cement plaster coat mixed with "ANTI-HYDRO" was applied to the inside of the walls and pits. Now they are absolutely and permanently waterproof.

There is not a single concrete waterproofing or hardening problem that cannot be successfully overcome by the use of "ANTI-HYDRO". It is an easy-to-use liquid integral compound that mixes readily with the gauging water without the aid of skilled labor. Results are guaranteed permanent.

Use "ANTI-HYDRO" on your next job. For over 25 years it has been specified by leading architects, engineers and contractors.

Store (alts.), 16 Lexington street, Baltimore, Md. Contract awarded Bowden Construction Co., 1607 Summer street, Philadelphia. Architect, H. Dwight Smith, 203 East Broad street, Columbus, Ohio. Owners, Nisley Shoe Co., care of architect. General alterations, plate glass, electrical work, store front, store fixtures, brass.

Bank (alts. and int. equipment), 857 Tenth avenue, New York City. Contract awarded Paul M. Sterling Co., 230 Park avenue, New York. Architects, Seeburger & Rabenold, 1524 Chestnut street, Philadelphia. Owners, Guild State Bank, on premises. Changing partitions, new partitions, wood, marble and rubber tile floors, vault, etc.

AIR SEWAGE

Recent announcement that the air conditioning system in the house of representatives at Washington within three months has collected 500 pounds or a quarter ton of dust and dirt which otherwise might have been inhaled by our congressmen is one of the most potent of arguments for controlled ventilation of public schools and other types of buildings.

told a committee of congressmen that the plant not only removes impalpable dirt particles from the air but restores it to the desired degree of heat and humidity and kills about 90 per cent. of the germs. Designers of the plant say the House chamber and galleries, if necessary, can be cooled to 50 degrees on the hottest summer day with virtually all humidity removed from the atmosphere. It is figured that each member of the house receives 30 cubic feet of cooled, dehumidified air per minute, with a similar allotment to every visitor in the galleries. Installation of the new air conditioning plant in the senate will not be completed until fall, however.

The 500 pounds of muck collected from the air by the oil coated pipes and water jets of the house air cleaning system is a pretty clear demonstration to congressmen of the menace of air sewage to public health. That there is such a thing as air sewage and that it is as repulsive as it sounds, is indicated by what the nose conveys, when an individual, fresh from out of doors, enters a crowded enclosure that has not been properly flushed out—ventilated. The most flagrant examples of such places are many public schools which are insufficiently ventilated because they depend on the spasmodic opening of windows for air change.

There are three items in the air engineer's score card which concern air sewage. These items are: Dust, bacteria, odors. They may be harmless enough in themselves. But they indicate in ventilation precisely what sewage in water intended for drinking indicates. The finding of an eastern commission on ventilation that vitiated air impairs appetite is alone sufficient evidence to indicate the menace of air sewage to health.

Air has three functions in ventilation. They are: First, its respiratory function; second, its bathing function to dissipate surplus body heat; third, its sewage destroying function, to reproduce indoors, what nature does out of doors. The third

function of air is involved in its first function, in the same way that the forces in a river operate, when sewage dumped into it by towns, has been destroyed, so that towns, lower down in the course, may draw their water supply from it, and again return their sewage to it.

But it is disease-laden air sewage—polluted from many sources—which blows in through the open window. Why thousands of children should be packed into schools and exposed to this menace through failure to provide ample mechanical ventilation, no one has attempted to explain. Public school systems in Detroit, Chicago, St. Louis and other up-to-date cities provide it. They have employed the best in modern air conditioning for their children. And they not only properly temper and humidify the air for health and comfort—but remove the sewage.

It was just a few years ago that science discovered that typhoid fever had its source in the pollution of water by sewage. Severe sanitary laws were adopted and enforced, to overcome this danger. Contamination and adulteration of food was another great cause of destructive epidemics, but this was largely eliminated. Now isn't it about time that even more aggressive steps be taken to combat the third horseman of death—air sewage?

VENTILATION REDUCES BUILDING FIRE HAZARD

Air Conditioning First Aid in Preventing and Combating Fires Experts Declare

Mechanical ventilation of buildings is the first weapon in the prevention and fighting of fires, according to the testimony of fire experts closely identified with the National Association of Fire Chiefs.

Modern skyscrapers, department stores, theatres, public schools and sport arenas with up-to-date air conditioning systems are less formidable fire hazards than other buildings without systems of positive ventilation, fire officials in leading American cities have discovered. This is true because the probability of a fire is thus reduced and if a fire does start firemen can stop it more quickly, it is pointed out. The same principle applies in reducing the danger of explosions in various types of

buildings whether due to dust or inflammable materials, firemen assert.

Chief Fred Myers, of the Toledo Fire Department, for example, declares that controlled ventilation of buildings is the best insurance against spontaneous combustion, which causes many fires, due to the fact that all parts of the building are properly "aerated" by an adequate and correctly installed mechanical system.

"To the average person, ventilating a building may appear as the wrong procedure, as it gives the fire fresh air that permits it to burn more brightly," Chief Myers said. "This is the thing to be desired as it gives the fireman a chance to enter the building and fight the fire at short range where the streams will do the most good."

Assistant Fire Chief Homer J. Jones, of the Canton Fire Department, who has made an extensive study of the subject, says the object of ventilation is twofold.

"First," he said, "it allows the smoke, heat, fumes and gases (products of combustion), which are lighter than air, to escape into the atmosphere. This prevents these elements to 'mushroom' along the ceiling, thereby causing the fire to spread through the building.

"Second, it eliminates the danger of 'backdraft' or 'hot air' explosions, due to the fact these elements are lighter than air they build up enormously at the highest point in a building and unless ventilation is provided a terrific explosion may result, with fatal results to firemen stationed in doors or at windows and with enough severity to demolish a building."

Chief Jones points out that it is the need for air and more ventilation to let out gases and fumes that firemen frequently are seen breaking windows and doors.

"A good example of the action of ventilation on fires is a bad rubbish fire in a basement," he said. "Assume there is a hood directly overhead to which is connected a damper-controlled smokepipe extending out through the roof with the damper left closed. The chances are you will have a hard fire to fight and experience a heavy loss. Open the damper and the smoke, heat and fumes are drawn up through the vent pipe, which permits speedy and effective extinguishing at close range.

"Too much emphasis cannot be placed on the importance of inspection of buildings. Each fireman should have the opportunity to inspect the places of business in this district at various times to familiarize himself with the location of stairways, elevator shafts, cellar doors, standpipes and locations of outlets on different floors, sprinkler system shutoffs and drains and their operation, outside engine connections to standpipes and sprinkler systems, stairway and elevator shaft openings onto roof and quickest way of opening same

from outside, skylights and see if permanently fastened, see if false attic exists and see if ventilation can be provided from lower floors to roof unobstructed."

EXPERTS COOL HOME THROUGH ATTIC GABLE

Exhaust Fan Draws Out Hot Air and Reduces Temperature During Torrid Spell

One of the best ways to cool the home during the hot weather is through the attic.

By the simple installation of an exhaust ventilating fan in the gable of the attic to carry out the extremely hot air of the second and third floors, temperatures throughout the entire house can be lowered by several degrees, ventilating engineers declare. In addition to this, the cooling effect of moving air—even though slight—is noticed.

It is important, however, for those who decide to install this real advantage in the home to provide a register or "air grills" in the second floor ceiling. This will permit the air from the first and second floors to be drawn upward through the gable when the fan is operating. This system of home cooling and ventilation through the attic is simple and not costly to install.

It has the further advantage of making the attic livable for play or sleeping purposes, even during the summer months. It drives out dusts which usually accumulate in attics and stale air. A prominent ventilating expert some time ago suggested that houses should be constructed so that each would have two or more flues leading from the basement to the attic. One of these flues could be used to take the air from the attic to the cellar by means of a small fan, while the other could be utilized for taking the cold, damper air from the cellar to the attic. In this case, a fan would be needed in each flue, but the method would be particularly suitable near the se coast where the air is usually damp during the summer time.

The gable system of ventilation through the attic, with the register in the second floor ceiling, should be used, of course, in addition to an exhaust fan in the kitchen for driving out the odors and greases of the cooking stove. These odors and greases should not be allowed to enter the rest of the house which they usually do unless controlled ventilation is used in the kitchen. The greases settle on curtains, draperies and plush furniture with destructive results, as any housewife knows.

KNOTTY WOODS AGAIN COMING INTO FAVOR

Imitation is a sure sign of appreciation and it is but a short step from the

growing admiration for the oldtime rooms paneled in knotty pine, to the present day fashion which favors the skillful use of other woods containing charming variations in grain effect.

This may seem to be something of an innovation, for except in the case of the cedar chests, which are so often seen in bedrooms and halls, and are always liberally bespeckled with knots, clear wood had come to be considered essential.

But an inspection of old furniture and the interior trim in rooms of other days, reveals that this has by no means always been the case. In fact, many examples of the use of knotty wood can be found, and when skilfully done, the effects are most interesting. The present tendency to use knotty wood is, therefore, not new, but is rather a harking back to an older fashion.

Supporting and emphasizing this trend of taste are the very real advantages of conservation of wood resources and reduction of construction costs. It is this angle of the subject that is emphasized by the National Committee on Wood Utilization, which operates in connection with the Federal Department of Commerce. As this Committee points out, small, tight knots do not mean defects either in beauty or strength, and the difference in cost between clear grades and those having a few tight knots as much as 50 per cent.

This is a real item in the cost of building. For instance, the growing practice of using knotty American walnut for the portion of a floor normally covered by rugs reduces the cost, making it economical to use this exceptionally attractive and desirable flooring, whereas, if nothing but the clear grade were used, the cost would be too great. The same is true of interior trim. The grain effects in knotty

walnut are most interesting and such wood is being used for this purpose with very satisfactory results and at a cost which permits the use of this exceptionally beautiful wood, even in homes of very moderate price.

KILLING THE GOOSE*

By PETER GRIMM, President, New York Real Estate Board

Poor construction, unless it involves dishonesty, is evidenced most markedly in cheap finish rather than in structural weakness, and as such has an immediate and direct effect upon the income of the developer. This is, in a measure, its safeguard. Therefore the facts we have to consider in a discussion of poorly built buildings are: badly planned buildings; poorly supervised building jobs; badly financed jobs.

There are too many samples of buildings badly designed and buildings badly financed, and such buildings certainly have an adverse effect upon the real estate situation. We can include in this class some pretentious buildings which serve to advertise their creators or owners.

It does not require any great knowledge to differentiate between first-class, good and mediocre buildings. Every experienced real estate man can testify to their condition after, let us say, 12 to 15 years, or even much sooner in some cases. There are houses in some sections of New York which go to pieces in two or three years. Their rent-producing ability is depreciated, their condition is run-down, whereas the first class, thoroughly well-built buildings in the same localities have an entirely different aspect. It is a

simple matter to read the lesson that results from this condition. The man who has bought such a building as an investment and sees it crumbling in his hands becomes an investor dissatisfied with real estate as a form of investment, and this has an adverse effect on the real estate situation.

The tenant who has moved into such a building on a fairly long lease and suffers the inconvenience of a plumbing system that goes to pieces, windows that rattle, doors that fail to function, floors that crack and become unsightly—such a tenant becomes disgruntled and a knocker as far as the real estate fraternity is concerned.

In contrast with this, I can point to apartment houses built some 40 years ago. They were well built, honestly built, and despite the fact that they are obsolete in design and lack many improvements of modern buildings, are still high-class and desirable.

I believe it pays to build well and honestly. That seems so certain a fact and one with which we find such ready agreement that I marvel so many poor buildings are built. There is no advantage in building cheaply, and I think a cheap building is always worth less than it cost, and, in the long run, probably more.

It may be a little bit beside the point, but it seems to me that the reason so many poor buildings are built is that the builder does not know his job or is careless in the directing of it. I do not pose as a builder or one who knows the building business, nor would I pose as an automobile manufacturer or tailor; and yet I know a good suit of clothes when I see it even as I know a good car when I drive it. The analogy of the car is interesting, because, not being a thorough-

going mechanic, I used to wonder why the specifications of an expensive car read quite as well as the specifications of a cheaper one. The answer is to be found in the manner of assembling the parts and the supervision of the work. Therein, it seems to me, lies the secret in creating the good building—the synchronizing of the work of the sub-contractors and the proper supervision of their work.

Perhaps we might look into other reasons why poor buildings are built. This leads to the speculative builder. The speculative builder performs a very useful and necessary function in a community. I am satisfied that without him little pioneering would be done and many of our most useful buildings would never have been built. To stop speculative building, if indeed it were possible would be wrong, for it would mean a cessation of activity. But the fault I find with some of the speculative jobs is that their utility depends upon temporary surrounding conditions. Lot line walls are used for actual but not legal light, with the hope of permanence, but are soon closed up by contiguous development. Apartment houses and apartment hotels are built above the market demand, and such conditions certainly have an adverse effect on the real estate situation.

Professional buildings, business buildings in residential districts, co-operative apartment houses, are built without efficiency or outstanding economy or other features which will make them successful. But the speculative builder will make a mistake if he assumes that in the execution of a certain promotion scheme it is going to be possible to build a structure with the best breaks on every uncertain item. We all know that every building costs more than the promoter thinks it

will cost and the speculative builder is directed to certain failure if he relies on the hope of getting the breaks instead of relying upon certain known factors. Many a speculative builder has gone into a job improperly financed and finds himself with the situation demanding a large investment which he did not expect to be obliged to make; but the building if properly planned and properly supervised and built will succeed even though necessity requires the builder to get more cash for the undertaking.

One factor affecting the real estate situation is the attitude of the public toward real estate investment in general. The lay public is influenced adversely by reports of failures, insufficient returns, failure to pay the bond or mortgage interest. The impressions of the lay public, in cases where there are losses, are due in part to the effect of badly financed and badly organized projects.

There are properties which are offered on extremely desirable terms; in the cases of buying the fee, with little cash, or in cases of long leases you may set down as a certainty that the fact that they are so offered put them almost beyond the margin of desirability. This must be so or they would not be offered on such attractive terms.

It seems a simple matter for anyone with little experience in building financing to take such a job and have high hopes of completing such a building. But he will find that it will cost him at least 20 per cent. more than the figures showed, and his hope to finance the over-cost with paper profits, such as expected advance rents, will go a-glimmering. The net result is likely to be a loss of a large amount of money for delays in construction due to unpaid bills, excess cost of financing, lower rents due to slovenliness in the finishing items. These are the speculative jobs which mean poorly constructed buildings, and these have an adverse effect on the real estate situation far beyond our power to estimate.

The dead goose lays no eggs.—*Building Age*.

A SUGGESTION WITH REFERENCE TO BUILDING CODE REVISION

Eventually some agency of unquestioned integrity and equally recognized ability must assume the authority to supervise the writing of the building codes of the cities of America.

Until this is done there will always be laxity in their provisions which should make for safety.

Until this is done there will always be discrimination shown as between materials.

Until this is done building codes will not accomplish what they are intended to do. They will not insure the use of the best materials to the best advantage

They will not provide the safeguards to life and health which they are expected to make mandatory.

Until this is done they will permit gross abuses of the best principles of building construction. They will continue to grant extreme privileges to those materials whose proponents happen to be politically powerful or more adroit than their competitors in manipulating legislation.

Building codes have always permitted this in the past.

They are doing it today.

And they will continue so to do until the framing of them is placed in some very definite and undisputed hands which are unfettered by material affiliation or political influence.

The big question is: Whose hands shall they be?

And just as certain as the sun will rise tomorrow morning and set again tomorrow night, this suggestion will be resented by the councilmen of every city in the country. For city councilmen are inordinately jealous of their authority, etc.

But it isn't a local question any more than is the Volstead act. Its menace is national. Building codes are not intended to favor materials. Nor to meet local conditions as a matter of policy.

They're intended primarily to insure safety and sanitation in building construction. This affects the whole people and, incidentally, investment. The problem should be handled in a broad way.

Probably the American Standards Association stands pre-eminent among the organizations having to do with construction. It is composed of delegates from all other organizations prominent in construction.

Its tasks and its accomplishments are altogether altruistic. It isn't paid for what it may do.

Possibly it might be persuaded to recommend for each state the personnel of a building code revision, this board to be authorized by legislative enactment and to be named by the governor upon the Association's recommendation. And of course to be paid by the state.

Such a board, free from political obligation, from material influence, made

up of men at the head of their individual professions, might, if any body of men might ever, be trusted to act impartially as a clearing house for all building codes of the cities of any given state. Its decisions should be final.

This may all appear idealistic, impractical, even fantastic, but something of the sort must be evolved if the grip of private, selfish interest is to be broken and the building code is to become the weapon of safety it was originally intended to be.

—*Building Economy.*

COST LESS TO PAINT THAN NOT TO PAINT

Some of us have our homes painted to make them look attractive. Some of us think that we cannot afford to. A luxury, we say—justifiable, perhaps, if any luxury is because of the recognized surroundings on home life. But still a luxury.

And so, we decide, painting must wait another season. Our budget is limited. We have an improvement to make here, a repair to make there. Thus it goes on from year to year. Little by little the house becomes run down. A change quite imperceptible in the progress, then suddenly we awake to a semi-dilapidated home, all the charm of trimness vanished.

Meanwhile we have spent money on the roof—mending a leak, of course, could not be put off. Gutter spouts, too, needed attention. Little repairs here and there seemed to run up the bills. And we come to the conclusion that an old house is as bad as an old car with its inevitable repair bills (whose size seems to progress in geometric ratio) or, if the house be comparatively new, that cheap construction may be cheap in the beginning, but it is all too costly in the end.

If you have ever reasoned this way, stop and consider. If your house is old—yes, it may be costly to run. But a house is only as old as it looks. And paint can keep it young. As for cheap construction, it is indeed false economy. But in many cases it is the owner and not the builder who is at fault. The construction may be of the best, but there is no roof which in time will not spring leaks

if its protective coating is allowed to wear away, no nail that will not rust, no siding that will not weather. When the wood is left exposed to the weather, moisture penetrates and subsequently dries out, with the resulting swelling and shrinking more quickly than those within, because they receive more moisture and dry out more rapidly. As a result, little cracks develop, making moisture penetration even easier. The surface roughens and in time the wood becomes badly weathered. Similarly, metal, if unprotected, corrodes. The roofs and gutter spouts, in need of paint, will rust and leak.

Quite aside from this physical deterioration is the depreciation of property which comes with a run-down condition. Once a house loses its touch of freshness it becomes undesirable property. The difference in price which it will bring is amazing, and the prospective seller may well consider the fact that a few hundred dollars spent for paint, inside and out, may mean the difference of a few thousand dollars in sale price.

While interiors do not weather as exteriors do, they too, are subject to a certain amount of physical depreciation if unprotected. But of greater importance, by far, is the fact that keeping a house in perfect condition is so easy if you do it regularly a little at a time.

When the woodwork begins to look soiled, give it a new coat of enamel. Troublesome redecoration is eliminated if you never allow a house to fall into poor condition. Incidentally, you enjoy at all times having your home at perfection. If, on the other hand, you allow your floors and woodwork to become cracked and chipped, paint removing will be necessary before you can again get a new finish, and three new coats—more work than in painting a place that is new.

The thrifty and wise home owner paints often, for he has learned that it costs less to paint than not to paint. Paint saves money because it is a surface protector, which prevents surface deterioration and wards off repairs, and saves money because it maintains the appearance and hence the value of your property.

SHINGLES MAY BE USED ALSO ON THE SIDE WALLS

We can use shingles not only on the roof, but also on the side walls, thus securing a covering which is unsurpassed in texture and color by any other means. It is a logical wall surface for a wooden frame, is weather resisting, and if left without paint will weather to exquisite colors. The various woods weather in a manner distinctly their own—white cedar shingles take on a pearly gray not to be matched with paint, redwood turns a rich brown.

Our forefathers sometimes covered the walls of their houses with hand split shingles; many of them still sound after hundreds of years. And very picturesque they are. Splitting the shingles along their natural grain gave them a resistance to the weather which is not found in our modern sawed ones. Yet we may catch some of the qualities of the old hand cut shingles by laying our modern ones so that the lines of shadow made by their butt ends are wavy or broken to relieve the uniformity of machine cut shingles.

When not laid too regularly, shingles give the wall a softness of texture which neither stucco, brick nor wood siding can reproduce. They do not have the smooth, combed, horizontal lines of walls protected with siding. The vertical joints which continually counteract the importance of the horizontal courses give a more picturesque texture. Sometimes the lower edges of the shingles are laid in an irregular manner, thereby giving the house an intimate, informal appearance.

We do not need as many shingles to the square on the side walls as on the roof, for more of their length can be exposed to the weather. Seven and a half inches can be exposed on the wall as against four and a half on the roof. Properly treated with creosote, their life will be practically doubled. If we are to paint them with creosote after they are laid, however, we must be absolutely sure they are dry, otherwise this process may do actual harm. Factory dipped shingles eliminate this danger.

Today there are innumerable effects of color and texture to be achieved with creosote stains on shingles. They afford the opportunity to use rich color, and unlike paint allow the grain of the wood to show, giving a surface almost ruglike in its softness. Even the picturesque, washed out effect which old shingle walls develop when the whitewash which has been applied to them, has grown old, can be imitated with creosote stains. Like other processes of building, care must be used here to obtain the most satisfactory results.

When using color, a combination of harmonious browns; tans, reddish browns and yellow browns may be used on the same wall—likewise on roofs—by using shingles which have been dipped in these tones. This mixing of various colors is

often overdone, but when good taste is exercised many beautiful results are possible.—*East Bay Builder.*

THE INFLUENCE OF COLOR

Spring has come and gone, having told gloriously the story of color as nature paints it. On every hand it flashed brilliantly, reds and blues and yellows, and purples and pinks and lavenders against the background of living green.

And nature is being reflected more and more in the construction and the decoration of the home.

Today color is a paramount essential in every household. No room in the house is without it. It extends even into the kitchen making attractive the pots and pans. Color is no longer incidental; it is imperative.

Fashions change. Tastes differ. Fads come and go, but the love of color is permanent, persistent, instinctive. It begins in babyhood; it lasts so long as the breath of life remains. The baby reaches for the most brilliantly colored toy; the palsied hand of age lingers longest upon the fabric of brightest hue.

Color has always been one of the distinctive qualities of brick. In the earliest days of brick-making color was the subject of experiment. In the ruins of ancient Babylon and Ur have been found bricks with highly-colored glazed surfaces, made for ornamental purposes.

Today the common brick, favorite material of our great-grandfathers, offers a greater variety of color than ever before. Color that is not for a season only, but is burned-in and lasting. Color that persists so long as the wall lasts. Color that exerts a permanent appeal.

Prospective builders find much of interest in investigating the possibilities of common brick for exterior walls. Not only in the beauty of the texture of skintled brickwork, for instance, but in the matter of cost. No permanent wall costs so little as that of common brick. None is so colorful.

—*Building Economy.*

THE HIGH COST OF PRICE CUTTING

President Hoover's Economic Committee reports that business men now have a greater need than ever before for knowing their costs and their right to expect a reasonable profit. Desire to obtain a volume of business has in many cases resulted in low bidding that is a sure forerunner of failure. When a man loses his mental balance he is soon removed to a place where he can do no harm, but when he loses his business balance, everyone must suffer until the final crash removes his unfair competition. Under conditions of this sort buyers realize that extremely low prices can be secured under sufficient pressure and by playing one builder against the other, thus demoralize

the market. All confidence is then destroyed and the consideration of quality and service is dissipated. The successful contractor today must have business back-bone. He must employ modern methods of estimating, cost accounting and efficient operation. When it becomes more generally known that a ten per cent cut in prices requires fifty per cent more business to bring in the same profit, builders will not be so anxious to obtain contracts at low figures.

The trouble of the past has not been a lack of business, but a failure to maintain prices that include a legitimate profit. No successful system of outguessing competition will ever be developed. The formula to correct this price-cutting evil may be found in education, in knowing costs accurately, and in basing estimates on knowledge—not in gauging the price by hit-or-miss methods. Selfishness, personal animosities and jealousies must give way to intelligent practice. It is up to every member of the great building fraternity to realize these facts, to recognize the need for reform, and to have the courage to demand a fair return for his services.

—*Building Age.*

NEW JOBS GO TO THE "GO-GETTER"

The days of handing out new jobs on the proverbial "silver platter" are past. In fact, not only the question of who will secure the work, but also how much work will be done looks for its answer from the builder himself. It is true that builders are craftsmen, but they must be much more than that. They must be active salesmen alive to the possibilities of their field. To encourage home ownership and building in general is the duty of every man interested in the building industry. Everyone will profit.

Times have changed. Banks used to sit back haughtily and wait for depositors to come to them. But not today! They, too, must go out and sell their services to the public. They must explain what they have to offer and why it is of value. This same principle holds true in the building business. Don't wait until John Brown comes to you about a new roof. Go to John Brown and show him why it will pay him to put on a new roof! The business is there if you will go after it. And if you don't go and get it, John Brown will have a new auto, take a trip to Europe, or spend his money somewhere else. There is no disgrace in "ringing door-bells." The public has become accustomed to personal solicitation and expects that type of service. It respects aggressive salesmanship!

—*Building Age.*

"Facts are stubborn things." Advertise only the truth about your product and watch the result.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

"ANTI-HYDRO" Plaster Coat Waterproofed Leaky Walls and Pits in this Post Office

The concrete pits and the walls of the pipe tunnels in this post office leaked badly. A cement plaster coat mixed with "ANTI-HYDRO" was applied to the inside of the walls and pits. Now they are absolutely and permanently waterproof.

There is not a single concrete waterproofing or hardening problem that cannot be successfully overcome by the use of "ANTI-HYDRO". It is an easy-to-use liquid integral compound that mixes readily with the gauging water without the aid of skilled labor. Results are guaranteed permanent.

Use "ANTI-HYDRO" on your next job. For over 25 years it has been specified by leading architects, engineers and contractors.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

New Jersey Contracts Awarded

Dormitory Building No. 3, \$41,846. Colony for Feeble Minded, New Lisbon, N. J. Contract awarded Richardson & Luce, 1524 Chestnut street, Philadelphia. Plumbing, Burns, Lane & Richardson, Trenton, N. J., \$4,749. Heating, Burns, Lane & Richardson, Trenton, N. J., \$3,857. Architects, Division of Architecture and Construction, Trenton, N. J. Owners, Department of Institutions and Agencies, Trenton, N. J. Brick, cast stone, 2 stories and basement, 45x45 feet, wing 33x25 feet, 38x19 feet, asbestos shingle roof, oak and pine floors, bluestone, stucco, ornamental iron, tile, metal lath.

Fetter School, Third street, between Walnut and Mt. Vernon street, Camden, N. J. Contract awarded Costanzo Brothers, Camden, N. J., \$38,996. Heating, Harry Knecht, Collingswood, N. J., \$3,850. Plumbing, C. H. Leupold, 1466 Haddon avenue, Camden, N. J., \$2,727. Electric, Franks & Sweeney, 1073 Haddon avenue, Camden, N. J., \$1,870. Architect, Walter Thomas Mayo, Camden, N. J. Owners, Board of Education, Albert Auster-muhl, 121 South Twenty-seventh street, Camden, N. J. Brick, steel, reinforced concrete, 1 story, 80x45 feet, cut stone.

Telephone Building, Ocean City, N. J. Contract awarded F. L. Hoover & Son, 1023 Cherry street, Philadelphia. Architect, John T. Windrim, Commonwealth Building, Philadelphia. Owners, Bell Telephone Company, Nineteenth and Arch streets, Philadelphia. Brick, steel, 2 stories and basement, steam heat, electric light, metal lath, rolled steel sash, ornamental iron work, slag roof, cement floors.

Hotel Flanders (alts. and add.), Atlantic City, N. J. Contract awarded P. G. Hannum, Georgia avenue and Thoroughfare, Atlantic City, N. J. Architect, V. B. Smith, Guarantee Trust Building, Atlantic City, N. J. Owner, J. Yon, Hotel Flanders, Atlantic City, N. J. Brick, steel, 6 stories, 70x60 feet, concrete roof, maple floors, 2 elevators, safety treads, waterproofing and dampproofing, electric light, tile, marble, steel sash.

Church, Sunday School and Fellowship Building, Hightstown, N. J. Contract awarded Willis Hancock, Hightstown, N. J. Architect, Norman Hulme, 1524 Chestnut street, Philadelphia. Owners, First Presbyterian Church, Rev. Tyack, Hightstown, N. J. Will contain kitchen, dressing rooms, etc.

Hotel, \$2,250,000. Park Place, Atlantic City, N. J. Contract awarded Roberts & Roller, 1700

Walnut street, Philadelphia. Architects, McIlvaine & Roberts, Otis Building, Philadelphia. Owners, Sealands Corporation, care of architect. Limestone, brick, steel, concrete, fire-proof, 24 stories, 138x200 feet, steam heat, electric light, tile and marble work, elevators.

Coal Silos (4), \$13,000. Southeast Corner Seventh and Pine streets, Camden, N. J. Contract awarded L. H. Blouch & Co., Drexel Building, Philadelphia. Architect, private plans. Owner, C. P. Mohrfeld, Seventh and Pine streets, Camden, N. J. Concrete, 16x40 feet.

Bridges (2), \$278,015.30. Routes 5 and 6, over Grand avenue and Northern Railroad of New Jersey, Palisades Park, Bergen County, N. J. Contract awarded A. Guthrie & Co., 10 East Fortieth street, New York. Owners, State Highway Commission, A. Lee Grover, Chief Clerk, State House Annex, Trenton, N. J. Excavation, borrow, pre-cast crib wall, concrete, reinforcing steel, structural steel.

Bridge over Channel, Lake Louise, near Broadway, Point Pleasant, N. J., \$12,000. Contract awarded Fred McDowell, Asbury Park, N. J. Architect, private plans. Owners, Board of Freeholders, Ocean County, Toms River, N. J.

Palmer, Frederick, Md. Brick, 2 stories, 50x75 feet, slate roof, yellow pine floors, roof ventilators, steam heat, electric light, metal lath.

KITCHEN EXHAUST FAN SAVES COSTLY DRAPES

Greases on Window Ventilator Evidence of Value; Cools in Summer

When cooking greases accumulate and thicken on the blades of the exhaust fan in the kitchen window, it is the best evidence in the world of the effectiveness of electrical ventilation of the home, according to air conditioning experts.

If this ventilating fan were not used, these greases would have streaked the walls of the kitchen and poured forth into other rooms of the house to spoil curtains, drapes, furniture, pictures and other decorations which frequently represent a considerable investment. The greases which accumulate in the fan, of course, are just a small percentage of those which are driven to the outside by the action of the fan. And the greases are more destructive than the odors which the fan takes out.

With the approach of hot weather, many housewives have learned, too, that the kitchen exhaust fan is an effective way to cool the entire home, or at least, produces a cooling effect on the lower floor. This can be done by leaving the front door open so that the fan can draw air through the house and out the kitchen window. Thus, the house is not only ventilated—which helps to drive out insects and moths—but the cooling effect of moving air is apparent.

The ventilating fan has about the same effect on the air and furnishings in the home as a big vacuum cleaner. The cleaning action of a vacuum cleaner is created by a suction produced by a small fan within. That is about the same principle in operating the kitchen exhaust fan, which draws the air with its odors, greases and dusts out through the window.

SCHOOL VENTILATION

Change the air in any theatre every three to five minutes and conditions are made not only more healthful for the patrons but decidedly more pleasant, due to the removal of disagreeable heat, humidity and odors. A theatre recently was completed in Detroit with a seating capacity of 6,000. The air conditions in a place this size would be impossible without mechanical ventilation or air conditioning.

The fact of the matter is that the theatres have cashed in on "millions" because of modern air conditioning. Thousands of patrons go to these playhouses during the hot spell to "cool off"—thanks to air refrigeration. The same principle applies to department stores, office buildings, sport arenas, and other public places where people gather. Ventilating equipment is considered as much a part of any modern building as the heating and lighting apparatus. Foul air, dusty air and reprehensible body odors are considered an insult to average intelligence. They are in the same company with pollution of water and food. Even progressive zoos have turned to controlled ventilation to protect the lives of valuable animals which formerly died from the temperature extremes and excessive humidity of the so-called natural method.

But now comes a self-styled "Commission on Ventilation" in New York state which admits all these things and says that they are very good but declare that a radically different requirement applies to school buildings, where thousands of children are housed. This commission would abolish mechanical ventilation of schools for the substitution of open windows.

That kind of logic is baffling. What public health authorities accept as necessary in practically all types of buildings and what scheming seekers after personal notoriety have found profitable to themselves, evidently does not apply where it is most necessary. Why should the school building or rooms therein be different from the average theatre, public auditorium or office where mechanical ventilation is imperative?

The chief rub against "open window" ventilation has always been that it cannot be controlled. Ventilation becomes a matter of haphazard guesswork—depending upon the whims, physical condition

and absent-mindedness of the teacher. Dust and dirt blow in. These are usually removed by air washers in the mechanical system. Perhaps the most potent argument against the conclusions of some of the so-called "commissioners" is the fact that ventilating engineers have established their ability to produce any atmospheric condition considered most desirable. Let the medical profession agree on what temperature, humidity and air motion are best for the health of school children and the engineers can produce it exactly—even with slight variations if wanted.

Those who compose the self-styled "ventilating commission" of New York state based their "open window" conclusions on tests conducted in specially selected schools in the east. Unbiased observers—such as trained engineers from the American Society of Heating and Ventilating Engineers—were not called in to supervise the scientific and engineering problems involved in these tests. And that would be very important in any survey or test to be truly scientific. It would be interesting to include, for example, a copy of the competitive bids on the initial installation. An attempt to economize frequently results in a wholly inadequate system. This may account for the popular favor accorded "open window" ventilation in some localities.

If reliance is to be put upon mechanical ventilation, it must be of the best, as one cannot as a rule supplement it by window ventilation without interfering with the whole system. Even an adequate system frequently is slowed down or thrown out of service to save the costs of operation. Until figures are available to the contrary, one can only believe that something of this sort has been the case, wherever objection has been lodged against a modern mechanical ventilating system, under automatic control and properly operated.

A German scientist once said that statistics, like sausages, depends on who makes them.

ROOF OFTEN RECEIVES LEAST CONSIDERATION

Father Time, that relentless old chap, never stops. Hour and hour, day and day, year and year, he grinds away, exacting his toll from all of us.

His gruff old captain, Weather, and those active lieutenants, Wind, Rain, Snow, Frost, and Heat, are always on the job, driving away, destroying the works of man. So they will work on your home, trying, striving to tear down that which you build.

Man from the earliest dawn of history has considered his home the most important and sacred of all institutions which

he has created. Always his aim has been to build a shelter from the elements that was more and more permanent. Always has he attempted to defeat old Father Time and his destructive cohorts. Today he is nearing his goal. Permanent building materials from which he can erect nearly every part of his home are available—awaiting his call.

However, it is still true that one of the most important items in the whole house—the roof—receives from many builders the least consideration.

It presents more surface for the attack of that destructive army and, therefore, should be the best protected.

The roof has been the point where home builders have often figured they could economize. Yet in practically every case it has proven to be false and costly economy. The necessary outlay for repairs, upkeep and replacement of a perishable roof is soon much greater than would have been spent in putting on a roof of permanence in the first place.

Not only have these items cost him more, but beautiful ceilings and interior walls have often been ruined, mounting up his expense for their renewal and repair. And then think of all the trouble and worry.

Is it worth the few dollars saved on the initial cost to roof your home with a perishable roof? Wouldn't it seem as logical to build your walls of cheap, perishable material which would need renewing every few years? No one would think of doing that.

Today, through modern scientific methods, permanent roofing material has been placed within the reach of the builder of even the smallest homes.

—East Bay Builder.

ATTRACTIVE FENCE ADDS BEAUTY

In winter or summer, fall or spring, an attractive fence, like a sundial or a blue room, will contribute beauty to a landscape. And, more often than not, the well designed inclosure will promote even neighborly admiration and approval rather than an offended, shut-out feeling. Primarily fences were used solely to prevent trespasses, but as people advanced in art and culture fences assumed a double purpose, that of decorating or enhancing the grounds they guarded. Consequently, fences of really exquisite design are appearing with increasing frequency.

For comparatively few dollars there can be erected an inclosure which will not only courteously perform the police duty of a "keep-off" sign, but which will add a final touch of nicety to a yard or garden. And furthermore, the task of building such a fence is far from difficult. The home carpenter can easily do the work in a short time.

—East Bay Builder.

HOME OWNERSHIP ROAD TO PROSPERITY

Home ownership as the best road to the prosperity of the individual and the country was the keynote of a conference of representative retail lumber dealers from various sections of the United States, held recently at the Drake Hotel in Chicago.

Organization of a council whose object will be to help home builders build better and more livable homes was the outcome of the gathering, which was presided over by Bror. G. Dahlberg. The lumbermen met primarily to discuss many of their merchandising problems, but the

home ownership theme was injected into the conference by Fred Ludwig of Reading, Pa.

"The soundest thing in America today is absolute home ownership," said Mr. Ludwig. "It is the keynote to the real prosperity of the individual. People should own a home before they own an automobile or a radio.

"A man who owns a home is a better citizen and a better influence for the community in which he lives."

—East Bay Builder.

Architecture, as an expression of American life, is dependent upon the materials that are best adapted to buildings. American architecture is the outcome of the steel age. This, in substance, is the message conveyed through messages from leading architects published in the Fact Book of the steel fabricating industry by the American Institute of Steel Construction, Inc., just coming off the press. This publication, in addition to presenting current statistics and shop directory, includes a history of steel construction and a tabulation of the most important bridges and buildings in the country.

In a special contribution made to the volume William H. Gompert, architect, of New York, says: "Everywhere there is evidence of re-energized and re-vitalized designing motifs to which all types of buildings owe their high standard of refinement and advancement of architectural design, brought about by the great adaptability of structural steel and the resourcefulness of structural engineering which in modern times has almost attained a state of plasticity."

Mr. Nirdlinger, architect, of Pittsburgh, says: "Steel's contribution to the advancement of architecture is answered by the progress of architectural design the past thirty years, or we might justly say, from the time Ernest Flagg completed the Singer Building (our first modern skyscraper).

"Unlimited credit belongs to the engineer and his associates, including the steel companies, all of whom have made it possible for the architect to design his structures with utmost freedom, and with their continued generous co-operation with the architect and builder I am certain that the various problems that confront the architect and engineer will be mastered."

Francis L. S. Mayers, architect, of New York, says: "The development of steel and its application to construction is the greatest factor in the development of the tall building of today, and without it, American architecture must have failed to keep pace with the progress of its people. The use of steel has made possible the set-back in the tall building, thus providing more air and light for the man in the street."

Anton Buyko, architect, of San Francisco, says: "Steel, which arrived in practicable form some fifty years ago, was not the invention of some far-sighted architect, anxious to introduce a vertical feeling into American architecture and fill American cities with skyscrapers. In the case of steel, as with all other materials, architects have but submitted to the new technological conditions and adapted themselves accordingly. In the chemical laboratories, in the industrial field, new materials and new technical processes are evolution of the process of manufacturing

evolution of the process of manufacturing steel, and because of their superiority, the old materials and processes have been displaced, giving the architect new structural units—new sets of toys to play with."

TEXTURE, COLOR, FEATURE STUCCO

BY THEODORE E. SHEAFER

Stucco, during the past decade, has partly cast aside its habitual conservative colors and textures and comes forth in a variety of shades and textures ranging from conservative to ultra-modern. It has evolved into a flexible building material which is carrying its share of the burden in the campaign to do away with the ugliness and commonplace in homes, characteristics that have given large sections of cities a drab and uninviting appearance.

Stucco ancestry dates back countless centuries to the time when man learned that he could effectively stop up cracks and kinks in his crude dwellings by caulking and chinking with a plastic mix of various clays. It was at first used as a source of insulation only but gradually developed into a product of ornamental possibilities.

There were periods during its subsequent evolution in which stucco did not enjoy a good reputation. Unsuitable cementing agents, improper underconstruction and poor manipulation contributed their share to instances in which a stucco job failed. The dark ages for stucco have disappeared with the advent of better building practice and the predominance of portland cement stucco, a product representing the culmination of extensive laboratory and field investigation for the provision of a highly durable plastering material.

Unlike many other producers, however, the conscientious manufacturer of a correctly formulated stucco cannot guarantee the success of his product on the job unless conditions of construction and application have been properly conformed with. The architect and the plasterer act as his co-manufacturers in producing the "stucco-on-the-job" product, and its merit depends equally upon them.

As mentioned before, there has been a tendency during the past decade toward a generous use of colors and departure from conventional designs and textures. Mineral pigments are now chiefly relied upon for color effects and avail a wider range than can be obtained through the use of natural color aggregates. Red oxide of iron for reds and pinks, yellow oxide of iron for yellows and buffs, brown oxides of iron for brown, and chromium oxide for shades of green, serve as a few illustrations.

Color effects alone cannot give beauty to a home. Form, texture and color must

be congruent to produce harmony and beauty.

French, English, Italian and Californian are examples of modern textures and are particularly well adapted to their rebuilding. Fine textures are usually more speculative types of architecture. The variety of textures possible is limited only by the skill of the craftsman.

Textures ranging from dainty to coarse may be had and are generally chosen according to the size and design of the suitable for small houses while the heavier textures are applicable to larger residences. With its versatility accentuated by modern designing and its durability effected through scientific research and correct building practice, stucco can conform to the architecture of all climates for projects ranging from small private dwellings to large public buildings.

Permanence of structure must not be overlooked. Unless the structure upon which the stucco is placed is sound and free from settling and shifting, unsightly patching will be necessitated. Modern construction methods utilize metal mesh or wire fabric backed with waterproofed paper or equivalent on frame construction or, stucco applied over concrete masonry.

The modern method of using wire mesh reinforcement or masonry units deliver a stucco exterior durable, structurally sound and fire resistive.

Besides being used on new structures of all types, it is a popular material for modernization purposes. It is relatively easy to taken even out-of-plumb walls, furr them out the required distance, and apply a stucco coat that is not only a beautiful material in itself, but has considerable insulation value.

There are a number of patented stuccos on the market, all of them having their own particular following.

Stucco is often waterproofed and made highly moisture-resisting so that it is made more permanent.

No attempt has been made to panegyrize modern stucco and stucco practice; rather a comparison has been offered between old and new methods of construction, design and color. It is felt that the potential field for stucco is increasing rapidly through the agencies of better understanding, improved methods of construction and the creative mind.

—Building Age.

Home ownership and its importance is stressed most graphically in an editorial by Arthur Brisbane, well known journalist and writer, on the front page of the magazine section of the *Cleveland News*. Such an editorial is not unusual for his views as relating to home ownership are well known to his millions of readers, yet this article is seemingly more vividly told because of the excellent illustrations accompanying the article.

There is perhaps no feature editorial writer in the country who has a greater following, especially among the masses whom he reaches through the scores of metropolitan newspapers who use his syndicated copy.

In part Brisbane says:

"Where your treasure is, there will your heart be also."

For a good man there is no greater treasure than his own family, his children, and the mother who has given him the children.

In a palace that cost a million, or a cabin built with his own hands, a man is happy who is independent and has his family to share his happiness with him.

OWN YOUR OWN HOME. Be able to say, living under your own roof and standing on your own land, "THESE

ARE MINE AND WILL BE MY CHILDREN'S AFTER ME."*****

To live in a place that you do not own, a hotel or rented apartment, is all very well while you make up your mind.

BUT IT IS NOT REAL LIVING.

The men who created this country, the pioneers, were above all things HOME SEEKERS. The most powerful desire in the normal human mind of our day or a thousand years ago is the intense longing for a settled and permanent habitation.

Among humans, still hunters and ferocious, women cultivated the fields, tamed wild animals, developed from grasses the grains and vegetables now used, that they might live and remain in one place—A HOME.

The words of a song to which every heart responds are "Home, Sweet Home."

In all ages men have paid tribute to the power and beauty of home life. Nearly two thousand years ago Cicero wrote:

"There is no place more delightful than one's own fireside."*****

The sacredness of a man's home has been recognized for ages, even by the most vicious. One of the most powerful passages in any public address is the following by William Pitt:

"The poorest man may in his cottage bid defiance to all the forces of the crown. It may be frail, its roof may shake, the wind may blow through it, the storms may enter, the rain may enter, but the King of England cannot enter; all his forces dare not cross the threshold of the ruined tenement!"

The unit of happy human life is the FAMILY, not the INDIVIDUAL.

The trinity of earthly happiness is the father, mother and child. The home is the laboratory in which civilization develops and is made worth while.

OWN YOUR HOME, the best that you can afford, and only what you CAN AFFORD.

Work for your home and the home that you OWN will work for you, in ten thousand ways.

—*Builder's Weekly.*

HEATING PLANT OF MAJOR IMPORTANCE IN HOME MODERNIZING

By J. E. FOSTER

The modern home must, above all things, be comfortable. People today regard a home as a place in which they are to live, and for this reason they insist on comfort.

No one can be comfortable if he is shivering. Unless his house is properly heated, his teeth will chatter frequently during the winter months if he lives in the temperate zone. For this reason, it is essential that major attention be given heating facilities when a modernizing program is planned.

In general, a heating plant must: Provide a uniform, evenly distributed heat; maintain normal humidity, and be adjustable to temperature fluctuations.

Many old houses are equipped with plants which can supply heat to the house, but do not warm it uniformly and are not adjustable to changes in temperature. As they bring some of the air in the house to a very intense heat, they rob it of its essential humidity. In many cases a heating plant of sound design may become antiquated, and for this reason it may be advisable to replace it.

Experience shows that a radiator system is the ideal method of heating a home. When radiation is used, the radiator passes off heat through the ether (a weightless medium filling all space), which in turn transfers it to other bodies. The exact process of radiation is rather hard to understand. It may be compared to the phenomenon of tuning forks. Suppose two tuning forks are set side by side, and one is struck. The second tuning fork will begin to vibrate, although it was not directly set in motion. The same principle operates when radiator heat is used. The heat vibrations from the radiator are transferred to other objects with which it is not in direct contact.

In general, there are two types of radiator heating: hot water and steam. The difference between them is implied in their names. There are also certain variations of each type. The home modernizer should consult his local heating contractor regarding the different types of radiator heating systems, and select the one which best fits his individual requirements.

Each system of radiation distributes the heat evenly throughout the entire house when the radiators are placed under the windows. As they do not heat the

air directly, they do not rob it of its essential humidity. They can be regulated to temperature fluctuations. They are economical to operate, and they last indefinitely.

A radiator heating plant can be installed in a building which has already been constructed. While such an installation can be made any time of the year, it is usually advisable to make it during the spring or summer, when there will be no necessity for warming the house.

The equipment required must be determined by a heating contractor. The method by which the calculations are made is a complicated one, involving mathematical formulae, and can not be discussed here. The owner should, however, decide what type of radiator heat he wishes, as well as other matters of a somewhat specific nature.

In the first place, he must determine the rooms he wishes heated. Of course, there are the normal living quarters. But there is no reason why he should stop here. By heating the attic, he can turn this part of his residence into a den or a children's playroom. There is also the basement. Most people give little thought to it. By installing an overhead radiator down there, a recreation room can be automatically created. If the boiler is set to one side, and a colored, jacketed one is installed, the entire basement can be used for recreational purposes.

If the home owner has a garage, he will naturally wish to heat this during the winter. He can do this by carrying a line from the residence boiler to the garage and installing one or two radiators or installing a small garage boiler with wall radiators.

The contractor should be notified in advance of the cubical contents of the space to be heated, including those in the garage. There are two reasons for this. In the first place, the size of the boiler is determined by the volume of heat it must furnish. In the second place, the amount of radiation is fixed by the space to be heated.

The decorative scheme of the house must not be ignored when the radiators are installed. Many manufacturers produce artistic radiators which will harmonize with interior furnishings. Radiator covers also add to the attractiveness of the rooms in which they are used. Incidentally, special covers are made for low radiators, so that those heating appliances can be turned into window seats with little trouble.

Heat regulators maintain even temperatures by automatically controlling the drafts on the boiler. A regulator is placed in some central location, and its mechanism is set to maintain a certain desired temperature. If the house becomes too hot, the drafts are closed. As the temperature drops, however, the drafts are opened. Some regulators are made to

control the heat in a single room. These are connected with the radiator and do not affect the temperature of the building as a whole.

While the radiator heat does not rob the air of much humidity, it is nevertheless desirable to provide additional moisture during the winter months. This can be done by attaching humidifiers to the radiators. These are long pans which are hung in back of the radiators and kept full of water. As this water evaporates it becomes a part of the atmosphere in the room, and in this way maintains its humidity.

HOMES MAY LACK PERSONALITY

People talk and talk about personality in homes, and yet they cannot tell you what it is, or how to build any into their own homes. As a result very many houses lack personality, although they may be very comfortable and pretty.

Houses that have no personality are houses that are owned by people who care to do nothing but eat, sleep or sit in them. They want their houses to be pretty, so they buy pretty things to put in them and then spend the rest of their lives protecting them from people. The whole pleasure in being a home owner is in being clever enough to make one's home pretty and yet useful to every need of every member of the family—and that takes cleverness!

A small house that is filled with boys cannot be made pretty with the same kinds of material as a house inhabited by a father and mother and one lady-like small girl. In the second house the floors may all be waxed or highly polished and the walls elaborate, but for the first some floors will have to be inlaid linoleum or tile and the walls simple and cleanable. But the linoleum or tile flooring may be just exactly as pretty as the polished hardwood flooring, but it will have a different kind of prettiness. A house that is planned to fill the needs of its inhabitants will not look shoddy before its time—and that is the first thing a family should think about in planning to modernize their home.

Some people are afraid to let the things that happen leave their mark on their home—they think that a house looks untidy if it looks as though it were lived in. Their houses can never have personality.

A certain wallboard man advertised in the Guide for awhile and then dropped out. We've had a dozen inquiries since then, asking for his address—every inquiry from a cash buyer. This is a common occurrence. It's hard to make some advertisers see the vital importance of a standing "ad."
